1. Announce: FORECAST

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: baldrick@terminator.rs.itd.umich.edu
Message-ID: <4c7pj4$q0o@lastactionhero.rs.itd.umich.edu>
Source record: 153756

Jim Baumgardner (STiK Telnet) and I (Antmail RSN promise) have relased a joint venture called FORECAST. It is tool for getting weather info on cities in North America. It requires STiK. Have to hurry back to the party right now, but it is available at atari.archive.umich.edu under Network/Stik/forecast.zip.

Happy New year everyone,

Dan Ackerman
baldrick@terminator.rs.itd.umich.edu

2. ST HW/SW for sale

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: whitema@vance.cig.mot.com
Message-ID: <4c7j5d$kdg@newdelph.cig.mot.com>
Source record: 153757

My brother sold me his ST with all of its software. I don't want/need most
of it, so I'm offering it for sale here. This stuff MUST go, so these
prices are negotiable and do not include shipping. Minimum charge is
$5.

Hardware:

=> SM 124 Monochrome monitor $50

=> Golden Image DS/DD Disk drive (unreliable). Includes power supply,
cable, and manual. $7

=> External 520 ST power supply. Only one year old. $10

Software (all come with manuals and original disks)

=> Timeworks "Partner ST". Includes calculator, Address/phone list, Alarms,
Memo Pad, Planner/Calendar, Expense Manager, Disk Manager, Vital
Statistics, Thesaurus, and a game. Comes in the typical Timeworks
professional binder. $8

=> Timeworks "Desktop Publisher". Create newsletters, flyers, reports,
catalogs, presentations, brochures, manuals, etc... $20

=> Timeworks "Word Writer ST" word processor. $10

=> Publishig Partner Desktop publishing. Includes Partern Fonts #1. $8

=> Microsoft Write word processor. $5

=> Springboard's "Certificate Maker". $5

=> Intracorp's "Business Card Maker". $5

=> Print Master "Art Gallery I" and "Fonts & Borders" with upgrade
to PrintMaster plus. Includes original PrintMaster disk (no manual
for PrintMaster). $8

=> Migraph's "LabelMaster Elite". $5

=> Clip Art Disk #5 (Zoo, Menu, Outdoor, Theater) Degas Files. $3

=> Atari's Neochrome. $5

=> Antic's Cyberpaint 3-D animator. $15

=> Migraph's "Easy Draw" drawing program and
"Easy Draw Personal Draw Art 1" pre-drawn pictures. $10

=> Batteries Included's "DEGAS". $5

=> Activision's "Paintworks". $5

=> DMJ's "View II" desktop replacement viewer. $4

=> Hybrid Art's "EZ Score" music notation and MIDI control. $10.

=> California Dreams "Vegas Gambler". Slots, Blackjack, Poker Roulette. $5

=> MichTron's "Juggler". Run up to seven GEM programs at once. $5

=> DTACK's "DBASIC". $7

Books (Free)

=> "Atari ST Graphics and Sound Programming" by Henry Simpson.
For use with Basic. Two copies. Free

=> "The Atari ST for Beginners" from Abacus. Free

=> "The Atari ST Book" by Ralph C. Turner. Free

=> "Compute's 1st Book of Atari ST" from Compute!.
For use with Basic. Free

=> "Atari ST Graphics and Sound" from Abacus.
For use with Basic. Free

=> "Word Processing Primer" by Waite and Arca. Free

Other (Free)

=> "Beginners Guide to the Atari ST" VHS Tape, by Bill Skurski. Free
=> Original Disks with no manuals: (Free)
-> Hoyles First Book of ST Games
-> Hoyles Second Book of ST Games: Solitaire
-> Michtron's "Kitchen Companion" with "American Home Cooking" and
"America Cooks Italian"
-> Pierstorff's "More! Graphics"
-> Michtron's "Flip Side"

If you're interested in any of this stuff, please respond via email
or call me at (708)303-0964.

3. HELP! "AUTO START"-PROGRAM?

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: hovila@messi.uku.fi
Message-ID: <4c7alv$qlj@luotsi.uku.fi>
Source record: 153758

Hi!

Just bumped to this weird problem... I'm trying to install Gemini desktop on my Mega-ST, and the installing instructions tell me to install GEMINI.APP as a "AUTO START"-program. That should be done by clicking on the program icon once, then changing a "AUTO START" parameter ON from a desktop menu. But -- where is a menu with that option? I've got TOS 1.4 (English version). Please help me!

4. Kit for Sale...

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: dave@mbha.demon.co.uk
Message-ID: <820585334_OASIS_@mbha.demon.co.uk>
Source record: 153759

Well, now that Xmas is out of the way, here is some kit I have to get
rid of. Prices where given are sort of firm, but don't be deterred
from making (sensible) offers. if you want to chat or get further
info, send some mail and I will give you a call or I will send you
the number so you can call me. Happy New Year to all!

FOR SALE
****

Matrix Coco 8bit graphics card.
Up to 256 colours at 800x600. terrific display of 16 colours at
1024x768. Comes with NVDI 2.5 (special version) and all software.
Looking for 170 UK pounds.

EOS 1.4 ROMS
6 chip set. This is a rewritten TOS 1.4 with all of the bugs taken
out and some nice new features added (boot delay, cycle window
gadget etc.). Very good and very fast.
Offers?

2400/9600 Fax Modem
Phonix modem supplied by Systems Solutions for use with
Tele-Office and Office Jnr. Sierra chipset. Very good and stable.
9600 fax and 2400 comms (yes,yes, I know - a bit slow but hey,
could be a very cheap fax/comms starter with s/w Office Jbr and
CoNnect!).
Offers?

Misc chips.
68000 (long) chip.
Blitter chip.
Offers?

Well. there you go, a bit of a jumble sale... It's all gotta go cos
it's cluttering up the cupboard and the wife's getting pissed off.

Holy Media! Try one of the Mac catalogs, eg. ClubMac 1-800-258-2622
sell them for $19.99 per cart, plus $3 overnight shipping on TOTAL
order, so you could stock up. They are item number S198 2010.

Hope that helps you out...

>programs are not running. Sometimes i get TOS error #35...?
>
>Any thoughts,help,suggestions would be greatly appreciated

It is probably the Macs screwy "data fork" problems that you are
encoutering - I've had the same trouble, if anyone knows why the
mac isn't transferring the files correctly add to the thread, in the
meantime this little trick will work 95% of the time on the ST.

Just highlight the file, then rename the extension from say .PRG to
PRX. Hit ok. Now reselect the file and rename it back to .PRG and
it should work. Alternatively just rename .PRGs to .APP / TOS to TTP
etc...

Good Luck

10. Re: Fun SCSI problem

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: Tom Lamparty <lamparty@telerama.lm.com>
Message-ID: <Pine.BSD.3.91.960101121833.24549B-100000@india.lm.com>
Source record: 153765

It not the way it is supposed to work,but I just went thru an
experience with my system where I wanted to add a new Syquest 135M
removable to the scsi chain that already contained a Syquest 105M and a
Seagate ST296N 85M, I'd had termination problems before and found that It
worked best with both old drives terminated! Now with the new setup I
have found that I have to have the first drive in the chain (Syquest
105M) terminated and also the last drive in the chain (Syquest 135M), but
had to remove the termination packs from the Seagate 85M! All I can say
is if you see sense errors in the upper right hand corner of your screen,
suspect termination problems! I know it is a bitch to keep pulling your
drives apart to change the termination, but (it seems) the only way to
get it right is try and try again!

>program. The notation faq is pretty bare too. Befor he spends a bundle on
>payware programs, it would probably be best if he messed around with
>something that starts off for free, and can later be upgraded...

MIDI work, and especially notation is complicated code. There are some of the world's finest MIDI and notation programs for the Atari - but they are _not_ freeware or shareware. Notator SL, Notator Logic and Cubase are the big three and the Atari iteration of them is wonderful. I bought a used version of Notator SL for $200 and was then able to resell it 6 months later for the same price, when I got a used copy of Notator Logic (the later version of the program). FWIW, my GF is a ultra-heavy MIDI head and _loves_ the power and accuracy of Notator Logic - says it blows away what she worked with on the Mac & PC. Now that Notator has been _ported_ to Mac & PC, that may change... But many professional MIDI heads I know say the Atari MIDI timing is way better than Mac or PC - and this is the hardware - it's faster and fewer crashes. Your friend could pick up a used (or new) version of one of the above programs for a very reasonable price - why not give the real thing a try, rather then wank around with second-rate shareware? But be sure your friend has at least 2.5 meg of ram - 4 meg is better - MIDI is very memory intensive!

>Oh yeh, no hard drive as of yet, just 2 floppies....

Get a hard drive f'Chrissake! Buy a used one for $100! They're quite available on line at that price. How can you ask a 1040 to work like a real computer without a hard drive?

>Slightly off topic: Any simple shareware WORD PROCESSORS out there??
>Something for doing up a letter, a resume, a small poster, etc...
>He's got a simple 9-pin epson, but again, why pay a fortune now for a
>payware thing, when he is just starting out????
>

There are _so many_ good programs out as shareware that it's hard _not_ to find a good text editor - 7UP and Everest come to mind... DTP is real code and again costs $. I use Papyrus and love it - own Pagestream and hate it (it's _so_ slow). But with a 9 pin printer any _poster_ you make will look rather shabby - take a file to a service bureau and have them laser print it.

13. Printer selection?

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <4c9p06$3cb@cxc1.cl.msu.edu>
Source record: 153768

I'm planning to purchase a printer soon, and am looking for comments
concerning the differences between HP deskjets and the Epson Stylus
lines. I also may have access to purchasing a used BJC-4000 Canon
but am concerned about printer drivers.

I'll be using it with PageStream and also with NVDI, so I'm
also interested in availability of printer drivers.

I expect my primary useage will be B&W so I'd also like to know about
how well these printers handle sealing the color ink cartridge.

Individual color carts: is this necessary?

Refills: are these an option, and if so what caveats can you describe?

Output quality to "normal" paper: what maximum resolution can I expect
from use with reasonably-priced paper? (I'd like to avoid having to
buy the pricey stuff except for absolute final output.)

Any other things to consider?

```
The Smooth One (smooth1@panix.com) wrote:
: Is there a way to download on-line graphics so I can veiw them off line?
: If so how do you do this? Thaanx in advance for any help you may give on
: this matter.

Depending what WWW browser you use, there will be a different method.
Assuming you use the Lynx text based WWW browser, you can just press \
("backslash") to show the HTML source, then see what URL the picture you
want is at, then press G and type in the URL. If teh URL is relative to
the current URL, you can use = to find the current URL.

There may be a simpler way, but this is the only way I have been able to
find, and it works pretty well in most cases.

Hope this helps.

15. Re: 14.4 Modem on ST - How?

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4c9p2t$cdm@status.gen.nz>
Source record: 153770

I did post previously stating that the problem with the 14k4 modem on ST has been fixed. The cable we used did no have the RTS and CTS pins connected. Now that we use a better cable, the problem no longer persists.

Since people are still posting replies, I decided to mention this fact again.

Thanks to everyone who made suggestions.

```
The UK Association of Atari User Groups relaunched
==================================================

Recently Ken Ward announced the end of his involvement with the AAUG. This
followed 15 years of sterling and much appreciated work on behalf of Atari
8-bit, ST and Falcon owners and User Groups.

Following that decision I contacted Ken and obtained his consent to take
over the AAUG and relaunch it within the UK as from January 1st 1996.

The primary purpose of the UK Association of Atari User Groups is to
maintain a directory of User Groups and their contact details in order to
enable individuals to join an existing network of support. Advice and
encouragement is also available on creating new groups in areas where it
doesn't currently exist.

The UK AAUG will continue to operate on a non-profit making basis, so all
postal contact requiring a response must be accompanied by an SAE and disk.
The directory will also contain information on groups that support Atari
software, Atari publications (both printed and on disk), PD Libraries and
Atari Bulletin Boards, FTP and WEB sites.

To this end I would ask that all organisations that need to be listed in
these directories, that haven't already been contacted directly on this
subject, confirm their current contact details as soon as possible to ensure
that they are included within my provisional lists.

Harry Sideras

UK Association of Atari User Groups
49 Haywood Road
Tile Cross

(Remember the SAE and disk)

Internet: sidcelery@cix.compulink.co.uk
hsideras@mettav.demon.co.uk
NeST: Harry Sideras on 90:102/143
TurboNet 100:1011/143
AtariNet 51:502/100.16
FIDO 2:254/108.16

======

Points arising:
1. Yes, I have moved again.
```

2. Because the original list passed to me was very old I'm attempting to confirm every contact address on it. Partly because of point 1 this isn' as far forward as I'd like. Still, I've only had to remove one group and have added six to the 'confirmed' list, so that's pretty good IMO.
3. Note, this listing only applies to UK Users.

regards

Hi all,

18 months ago I saw a message posted here from Patti Barbiero listing the Atari United directory of User Groups in the USA. The EMail address given at the time was atariunited@delphi.com but mail to this address now bounces.

If anyone knows the current EMail address or if Patti is still around here could they please contact me at one of the addresses below.

Many thanks

24. FS: Jam Packed Jaguar Package

Newsgroup: comp.sys.atari.st
Date: 1996-01-01 00:00:00 UTC
From: DOMINGO@news.delphi.com
Message-ID: <4c89rd$6nc@news2.delphi.com>
Source record: 153779

*** Jam Packed Jaguar Package (tm) for Sale ***

What? You didn't get a Jaguar for Christmas? Don't have enough money to buy a "real" next-generation system? <evil grin> Then I have a deal just for YOU!

The Jam Packed Jaguar Package (tm) includes:

An Atari Jaguar Console (duh) [no manual or inside box packaging] w/2 controllers, RF modulator, AC adaptor & composite A/V cable

Alien Vs Predator [manual only]
Brutal Sports Football [no inside box packaging]
Bubsy Bobcat [no inside box packaging]
Checkered Flag
Cybermorph [no box or overlay]
Evolution Dino Dudes
Flashback
Hover Strike
Iron Soldier [no overlay]
Raiden
Syndicate
Trevor Mcfur in the Crescent Galaxy [no overlay]
White Men Can't Jump w/Team Tap
Wolfenstein 3D [cartridge only]

I have the boxes, manuals and overlays for everything except where noted. This is a second Jaguar system that I really don't need. I am not jumping ship. I just need money to buy the Jaguar CD and some new games.

Price is $350.00 firm including shipping anywhere in the continental U.S. COD or faster shipping is extra. This price works out to about $50.00 for the Jaguar and $20.00 for each game!

32. GDOS fonts...

Newsgroup: comp.sys.atari.st
Date: 1996-01-02 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <4ccb95$5m2@orm.southern.co.nz>
Source record: 153708

Hi Everybody...

I have recently grabbed VDI-Font v2.1 from the net. I think this has potential, but I need some decent GDOS font families, similar to that supplied with NVDI 3 (ie. the Monaco Mono font @ 8, 9, 10, 12, 16, 18, 20, 40 point etc...). I have checked out the Gdos font archives on umich.edu but have not found any that work very well, or are grouped as a complete family as the Monaco font is. Is there anywhere on the net that holds a collection of font families I can look at?...

Thanks in advance for your replies,

Chris Wilkinson, secretary of the Canterbury Atari Computer Enthusiasts group, Christchurch, New Zealand.

You need to use new config files - check out the new ones in WWW116
and modify yours accordingly, there are differences in the way they're
put together by comparison with WWW107

Then it should all work just fine!

>

I just tried this (thanks to an e-mail) and got about 2/3rds of a page
of spaced letters and numbers thus:

3 3 1 Y

repeated down the page. Hmmmm....

I tried both the drivers from Calligrapher - DESKJET.sys and
DESKJET5.sys - one added a lower case p after the Y for about 4/5ths
of the list. Can't remember which was which tho'. Maybe I should try
some other progs.

Source record: 153711

Chris Wilkinson (chriswil@southern.co.nz) wrote:

: I am considering purchasing a Hewlett-Packard Deskjet 400 printer for use
: with DTP software. I use NVDI 3 for vector fonts on my Falcon, but have
: noticed that no driver for NVDI directly supports this printer. Does
: anyone own a DJ400, and is it possible to use this printer to the fullest
: of its capabilities (full dpi, colour upgrade etc...), with the current
: NVDI version I use (v3.01).

I just purchased DJ660C - and HP really tries to make the lives of us
"non-PC-users" difficult =(No support and some nasty surprises.

But though HP doesn't help us a lot, there are solutions.. I think,
DeskJet 500- and 500C drivers should work well for you, like LaserJet 4-
and DeskJet 550C drivers work well enough for 660C.

NVDI 3.01 doesn't seem to support color at all (I've tried..). 4.0 does,
and so does 3.02, so it's time to update NVDI I guess..

You should be able to make a "perfect" driver for DJ400 using the
printer driver builder program provided with NVDI. What you need, though,
are the PCL-codes - and unfortunately, HP doesn't seem to give them away
very openly today... =(

I think (no joke), HP wishes to turn us into Windows-users. That would
benefit them, if not us... Their product policy supports this "theory",
at least...

Greetings,
Tommi

36. Configuring DeskJet 660/850C

Newsgroup: comp.sys.atari.st
Date: 1996-01-02 00:00:00 UTC
From: thietavu@news.abo.fi
Message-ID: <4cc5l9$f7d@josie.abo.fi>
Source record: 153712

Owners of these printers know that the tone cartridges can only be
aligned (among many other functions) using DOS/Windows software.

So what now?

Suppose some of you happen to have the SoftPC 286-emulator...
Of course, none of you do, because if someone did, our law-experts
would tell him he's a veeeeeeery bad person and a great sinner 8-) !
A law-breaker!

Sorry - law is a serious subject, but sometimes a bit ridiculous, too.

So, let's just suppose....

What about using the DOS version of HP Control Panel on SoftPC..?

Until we hopefully have a working HP control panel of our own.

It's the _only_ solution we have now, so why not try?

Greetings,
TH
(sometimes weird ideas might work ;-)

ATARI MIDI STUDIO PACKAGE FOR SALE

Everything here is in excellent condition. I have done a lot of
professional musical works with this system, but my business situation has
forced me to switch to Mac. It really is sad to see my Atari go, but
better letting it be with someone who uses it than letting it sit in the
corner of my studio.

* Atari 1040STe Computer with 4MB RAM
* Atari SM147 - 14" Monochrome Monitor
* Atari Mouse
* Steinberg Cubase 3.01 - MIDI Sequencing Program
* Dr.T's XoR - Universal Patch Editor/Librarian
* Band in a Box Version 5 - Musical Accompaniment Program
* Spectre GCR 3.0 - Macintosh Emulator for STe
* Stalker 3 - Terminal Program
* Cardinal 2400 Modem
* Various Shareware Programs

All commercial programs come with original disks and manuals.

Asking $650 plus shipping. (I'm in Brooklyn, NY if you'd like to pick them up.)

Please send me e-mail if interested.

Naoyuki (nao@interport.net)

I guess your problem is due to the shell, running the tools as a parallel process without waiting for the tool to have finished. Another explanation would be that the actual output waits somewhere until the tools terminates. This could be due to both the shell and the tools.

Try a different shell first, as there are several to select from (sh, ash, bash, tcsh ...)

Cheers Peter

in reading /cache/0000001.
In both cases I am using the same stik and the same stik_cfg folder.
So it must be a problem with Cab / Cab.ovl. Anyone know how to solve it?

Yours /SN

46. Re: Web Browser for Atari ST??

Newsgroup: comp.sys.atari.st
Date: 1996-01-02 00:00:00 UTC
From: efac001@alpha.qmw.ac.uk
Message-ID: <4cb358$b3@epsilon.qmw.ac.uk>
Source record: 153722

On Steph@wuss.demon.co.uk, Steph Taylor (Steph@wuss.demon.co.uk) typed away:
: For full 'net access on an Atari, two packages are needed:

: OASIS v1.35E for E-Mail, Usenet, FTP & Telnet
: WWW116 for limited WWW access on SLIP connections only
^^^^^^^^

Hmm.. i tend not to agree with that.. you get full WWW access with
WWW116, plus you also get IRC. Also, in a month or so (hopefully)
there will be telnet, mail anf ftp available for STiK (which is in the
WWW116 package)

47. Pagestream and Canon BJ's

Newsgroup: comp.sys.atari.st
Date: 1996-01-02 00:00:00 UTC
From: rickjnav@nic.wat.hookup.net
Message-ID: <4cd059$s40@nic.wat.hookup.net>
Source record: 153723

I find I am having trouble printing both with a BJ5 and a
shiny new BJ4100 using Pagestream...for some reason the print
starts about 1/4 inch lower on the page than it should, and the
fool printer seems to think that the page is 11 1/4" long...I have
to feed another page in and let it run through. I can print
exactly the same document to a Post Script laser printer, and the
alignment is perfect. Does anyone know of a solution to this
snag?
Last month I saw an article starting about a users group
for Pagestream, but I misplaced the address...please e-mail me if
you know who it is I should be contacting.

Thanks much. Rick J.

48. HENSA Archives

Source record: 153725

Has anyone any contact with the author of the doors game, ARMADA ??

I'd like to get the latest version and have some questions. The docs I have list a bbs to call, and his bbs (??) number. I've tried both, but the sysop of the bbs never seems to upgrade me so I can look to see if there is an english version newer than mine, and I don't get a reply on the authors phone line.

Also, I've tried sending mail to the internet address and got no reply.

Anyone?

No, TOSWIN isn't usable and TOS2GEM also not.

> Since MagiC reads the INF file to see which terminal is defined I surmise
> that an alternative might work (vt0100 would be good for many purposes I
> suspect). If this is correct, can anyone suggest a good alternative
> please?

Maybe possible but i really have no idea how it's setted up, VT52 does als
change the exception vectors for a while (i've noticed this when my own BBS was
using these and when VT52 is called it has effect on it so VT52 does hook
himself very deep into the system. But otherwise.. normally i don't have
any other problems with VT52, everything works fine.

Old nasty programms like GFA stuff can give problems, first the extension
should be .TTP or .TOS instead of .PRG and then it's a gamble if they are
clean enough.

Let me guess: You have an ST and a Link-cable style SCSI adaptor? If so, then your observations are perfectly OK and match the SCSI specification of having both ends of the chain terminated.

NB: None of the Link-cable style SCSI adaptors that have been available for Atari machines are terminated, so that either the first and last drive on the SCSI chain must be terminated.

bye, Peter

Just incase any of you missed my original series of things to try out to fix the "cannot find file cache/00000001" in CAB, I re-installed it to find out what happened and how to fix it and it's fairly simple:

Just make sure that the cache path is set up correctly and then create a file 00000001 in it, I used Selectric's New Item option to do this but you can try a text editor or something, the one I created was zero length but I doubt that this matters, make up any old URL and type it in. It should show a blank page, then goto the clear cahe options and all should be fine! The things I go through for you lot...

Absolutely not, AFAIK they still do not currenly exist or at least HiSoft still haven't sent me mine but it only allows you to password and write protect your disks which doesn't really seem to be the most important thing and although i'd like them I wouldn't worry about them.

I have aquired a new TT system with more RAM, so I am selling my old one.

This includes:

(1) TT030 w/ 2megs ST ram w/o harddrive
(1) flakey 2meg ST ram board
(1) PTC1426 color monitor
(1) dead (I think it's the power supply) TTM195 19" monitor
(1) SLM 605 laser printer
(1) Spectre GCR w/ROMs

and I have various other 520ST items including tons of software

the computer is in fine shape, but the harddrive case is a different
color than the computer case. The keyboard and mouse work as new. The SLM
605 is in great shape also.

I will split things up if the offer is good.
Email for more information or call (805) 481 4822

The price is up for grabs...

drop me a line !!!

>What can I use?
You should be able to use most programs with the help of HSMODEM. HSMODEM allows the substitution of a higher speed for up to three of the older, lower speeds available in the port configuration menus of most terminal emulators.

I can't remember, off hand, which way round the substitutions work but it's not hard. When you configure MFP.PRG you arrive at one option at which you would normally put the letter u in six positions. These are actually three pairs of figures so that you could enter, say, 300 in one and 38400 in the next and (assuming I've got the numbers the right way round) when you select 300 baud in the menu you actually get 38400 at the port.

Hope this helps,
Keith

Hi- I have the following MINT condition Falcon for sale :

Atari Falcon 030
-Tos 4.04
-65MB Conner Internal HD (uninstalled)
-4MB Ram on Ram Gizmo Board

Included Hardware
-Screenblaster II Hardware/Software Combo (1280x960x16)
-Genius Mouse
-Standard Joystick

Software
-AtariWorks/SpeedoGDOS
-MultiTOS
-System Audio Manager and other included system software
-Ishar Falcon
-Pinball Dreams
-25+ disks of PD/Shareware
-More, but I can't think of what exactly at the moment . . .

-Less than one year old
-Will trade for C-Lab Falcon MK-X :)

Additional Hardware for Sale
-210 MB External Microtech HD with SCSI-II cable for Falcon $100 with
Falcon purchase
-Seiko 14" Trinitron SVGA Monitor $140 with purchase

Thanks!

>
Each time a doc is loaded from the cache CAB.OVL is supposed to check
across the net whether the actual document has been changed meanwhile,
and, if so, to discard the doc in the cache. I'm not sure whether the
actual CAB.OVL implements this. If it does, then even when the doc is
loaded from cache, a few bytes go across the SLIP connection (and may
cause problems).

> click on OK in the URL box and up pops the error after a quick flicker on the
> Hard Drive activity light. I might be completely wrong but I hope not, any
>
Of course, the problem might still arise from CAB, but what I'm saying is
that you can't rule out CAB.OVL and STiK so easily !

Cheers Peter

I had difficulty getting it to work properly.

I could not run it from a hard disk & when I eventually got it working it
from floppies, I could not save games.

I agree about the game, it is impressive & if the above paoblems could be
resolved, I would be interested in registering.

BTW, ST Format (January I think) mentions more levels will be placed on a
cover disk.

This is NOT a good way to solve problems, you probably just suppress
somehow other problems. There is only ONE way to properly terminate an
SCSI chain and that is at _both_ ends. However, very often the host
adapter has terminators build in so that it can only be used at one end
of the chain. If placed in the middle even the adapter _must_ work
without terminators.

Doing things your way may even damage your SCSI devices, if you have
several drives and try to "terminate" each, because the bus drivers are
overloaded ! They are designed for the load of _two_ termination
networks, that is at each end of the chain.

Closely related to this is that you must never attempt to split an SCSI
chain in a way that in an Y shape one device gets directly connected to
three other ones !

Cheers Peter

Did -vdq work as well? That should be a _lot_ faster if it does, especially
on scrolling around a large picture.

>work, what is the future for mgif? >256 colours? display in a window?

MGIF handles 24 bit colour and uses Falcon true colour mode to great effect
already. Unfortunately, doing >256 colours using the VDI is not that simple.
If anyone has got any working code, I'd be interested, but I must admit
it's not a top priority.

Windowed display is of course on the list of things to do in the future.
Since the current scheme works rather well (IMO), I don't consider it very
important at the moment, though. If I get enough requests for it, I might
change my mind of course.

Unless any serious bugs in v5.00 are reported, I think the most important
things to do for the next version will be:
- Add some DSP support for convolutions etc
- Finally implementing a graphical 'intensity change' dialog

All other ideas and comments are of course very welcome.

>Also, if I save the executable config and then the cnf file as
>prompted, it crashes when reloaded. Something I am doing wrong maybe?

Hmm, I tried reconfiguring with the supplied MGIF.OPT file and it worked
perfectly. If you try it with a .OPT file with _lots_ of switches set,
you could overflow the internal buffer space, though.
Please, let me know by email what you were doing.

Source record: 153604

Hi soccer fans,

I have been a keen player of Kick OFF2 and Player Manager for some time. However, Does anyone know of any editors for Player Manager that enables you to amend skill levels of teams? I have a small shareware editor for creating and amending squads for Final Whistle but of course that's not compatible in reverse with either KO2 or PM

Also, any hacked versions of Player MAnager around or keyboard commands that provide infinite % points to stop the Board sacking you even though your team is on a real roll? It's so annoying!!

Anyone want to swap teams etc.??

Many thanks

Mark

I beg to differ! Try downloading the 0index from umich! It's a
text file, so the compression factor comes into play and you will get
close to 38.4kbps with a 14.4k modem. That is if both you and your ISP
have compression enabled! On already compressed files, ie. zip, zoo, lzh
arc and gif and jpg's then you might as well not bother with the upgrade
as the old 19.2 is actually faster than you can reach with a 14.4Kbps
modem!

82. ** ST-Doorgame Authors! **

Newsgroup: comp.sys.atari.st
Date: 1996-01-03 00:00:00 UTC
From: Rosemary MacCallum <mccallum@inwave.com>
Message-ID: <4ceb7a$k97@homer.alpha.net>
Source record: 153609

I would like to start a list of CURRENTLY supported or developed doorgame
for the Atari ST/etc related BBS world. The point being to make sure ST
sysops can get information on where to obtain new doors/updates to doors
and where they could download them when needed. The list would also include
entries for old/unsupported doors (eg. Axolotl Football)

I could post updates to the list whenever applicable and maintain a file
area on my bbs for free downloads if sysops have no luck contacting the
appropriate support bbs...

Sound like a plan? OK... I need your help...

IF YOU ARE an author of a BBS/Door past or present then could you email me
at mccallum@inwave.com and tell me if your door is supported currently or
you have moooved over to another platform. Also include a current address
and any other information you see apropriate (Shareware status/fee/BBS Number).

There are some of us who WANT to register doors on our systems but CANNOT
find the author anymore...

Thanks - Andy @ Mindbomb BBS

85. Need help with "Gulam" shell

Newsgroup: comp.sys.atari.st
Date: 1996-01-03 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <30eaae743f418d1@sn.no>
Source record: 153612

I'm having some problems setting up the Gulam Unix-like shell.
I've already edited the variables in "gulam.g", but I still have a couple of problems.

The keyboard setup seems to be for a German ST, as I get all the wrong characters when in the shell.
I have a UK keyboard/TOS, and TOS 2.06- how do I change the keyboard setup for my own use? I didn't see anything about this in the configuration file.
I did however have a look at a file called "gulam.hlp", but I have no idea where it should be placed or anything. Any ideas?

The second problem, though not as critical as the above is that the mouse still interferes... I've set the mouse to "off" in the setup, so at least the mouse pointer disappears, but the mouse still messes up the commands if I move it (so why move it?- well, it starts moving on it's own at times, and until I get a proper mouse it's very irritating).

I'm also wondering how the shell could be installed within my system, so that it can be called upon from other programs- I see that in some menues there's a "start shell". Do I set this in the "environment" variables? Something like: set shell= d:\system\shells\gulam\gu.prg ?

Finally, how do I add more commands to it? I miss several commands, like "more" (yes, I know Uemacs replaces this for now, but I'd like a plain "more" instead), "less", "tail" and a few others. Are these added by having .TTP programs for the commands? Where can I find them? I'd like to have a complete as shell as I can have, getting as close to the tcsh shell I'm using in unix.

As I already said: Please use the *latest* version of JPEGD.PRG, dated
Dec 25 1994 (9294 Bytes)! If you can't find it (the Atari archives I have
seen do mostly have old versions), I could post the ZIP archive (jpeg_dsp.zip
- 19294 Bytes) to someone by email in uue form (but only *once*, this person
should then redistribute it as necessary).

This version includes some of my enhancements and runs OK under 'normal'
circumstances.

> Though it might be a bug in the decoding algorithm, it is also possible that
> the communication between DSP and RAM is also suspect!
> I'll check it out if JPEGD uses handshake or not.

Handshake isn't used by JPEGD during decoding, but it uses only XBIOS calls
for communication between CPU and DSP, no direct hardware access! That means,
that for unusual speed-ups of CPU or DSP against the other, the XBIOS
functions
have to be adapted! My MPEGDSP against that uses handshaked communication
via direct hardware access. There are advantages and disadvantages of both
methods.

By the way, the next version of my utility 1stGuide supports multiscan and
progressive JPEG, I'll upload it next week on
ftp://swrinde.nde.swri.edu/pub/png/applications/
(see also http://quest.jpl.nasa.gov/PNG/pngapvw.html).
There will also be TrueColor-IMG support and a little correction in interlaced
(Adam-7) PNG handling.

If I get some time, I'll update the JPEGD appropriately for progressive JPEG
support.

Regards,
Guido

PS: *Good* graphics formats end with 'G': JPG, MPG, PNG, IMG :-)

I don't know if my speeder is faulty, but the problem is located ta the
Dsp_ExecBoot (and the Dsp_ExecProg which calls the Dsp_ExecBoot (using bsr
or jsr)). Of cource the rom code calls Dsp_ExecBoot with the caches off
during the boot up. So turning off the cache before calling Exec_boot AND
Exec_Prog is a stupid but still working solution. I wrote a small patch that
does this stuff but it is 4.04 specific. Suerly someone else can do it the
right way

PageStream 1.8 came out before them Canon Bubble Jets hit the
market! If it emulates an older type then you might be able to use one of
those, but the newer ones won't help as there was a change in the way
they worked (I think). Best bet is the advice given below! I did check
both my original ver 1.51 disks and the 1.8 upgrade disk, and no Canon
drivers at all. Only inkjet printer driver is the HPDJ500! Sorry!

How old is the doorgame? Most ST doors seem to be from around 1990 and are
usually not supported anymore, else the support BBS has changed several times.

I've ran into this problem a number of times, it would be kinda nice if a list
of CURRENT doors could be struck up for us remaining sysops, eh?

Hmmm... not a bad idea!

Nope. I've got 2.46, but if you run HSmodem in the auto folder it can
go a lot higher (115000?? or something like that).
I've got the RSVE circuit and mine and it works fine with that.

From what I read in this newsgroup, it's not quite "full".. There are still
problems with forms, it appears, and there's no "mailto". So maybe "almost
complete" would be more accurate than "limited".

>Also, in a month or so (hopefully) there will be telnet, mail anf ftp

: >
: Sometimes its hard to figure out what is meant. Lets get to the point :
: STiK doesn't do any connects, it just provides the means for it (the
: TCP/IP stack). The connection is handled by CAB.OVL. The same holds for

: > cab begins reading a page
: >
: CAB doesn't read any page from internet, in fact, CAB doesn't even know
: how to talk to STiK. This again is done by CAB.OVL. The sequence is :

: 1. The user types in an URL (or selects one from an already read page).
: 2. CAB calls CAB.OVL and passes the URL as parameter.
: 3. CAB.OVL disassembles the URL, decides which host to connect to and
: initiates the connection by calling STiK with proper IP adress and
: port number.
: 4. When connected CAB.OVL requests the document by sending the appropriate
: command, using STiK.
: 5. The document comes in via STiK, and is saved into a cache file by
: CAB.OVL (filename has been supplied by CAB).
: 6. The connection is closed by CAB.OVL and control is transfered back to
: CAB, which reads the file from the cache folder.

: During the whole procedure of fetching a WWW page the only thing CAB
: itself does is displaying the corresponding status message ("Connecting
: to ...", "Read Data XXXX/YYYY Bytes", ...), being told to do so again by
: CAB.OVL.

: So please lets separate things that should not be mixed. I very often
: hear people complaining about errors and blaming CAB although CAB
: obviously cannot be blamed ('cos it's simply not involved).

: > same problem on WWW116 as well.
: >
: Obviously, since STiK and CAB.OVL have not been changed in this release.

Not all of the cache-file problems that peeople are having are due to the overlay. I'm using CAB 1.16 under MiNTNET (I wrote an OVL for it), and I can see what CAB is asking and doing.

1. CAB checks its cache. If it finds the file it wants there, then it uses it.
2. Assuming it didn't, it asks CAB.OVL to load the page, and save it in the cache folder as '00000001'.
3. If the OVL indicates success, then CAB takes the file, and renames it to something like '00000001.htm' or '00000002.gif'. (Note that a new file will still be saved as '00000001', regardless of what number the cache is up to. That is always the 'working file'.

NOTE: If the OVL indicates failure, CAB just ignores it, and then whinges about cache-files.

Don't take this personally please, but I'm fed up with all those very
incomplete For-Sale posts. We don't all come from the US of f****** A.
Shipping a 30.00 monitor from Memphis over to, say, Stockholm is
a bit expensive, right ? Please, everyone, if you have something
for sale, state the country/state you're living in.

Secondly, there are other currencies than dollars in existence too.
What do you want 30.00 of ? Yen ? Francs ? poststamps ? candy-bars ?

L8R,

I'd have to agree with this. I've recently been playing around a lot with video digitising/playing on a PC - and the fact that the AVI format is standard between all the products I've been using is a great help.

As it seems to be a proprietry MS format - I presume something based around MPEG might be preferable.

The main downside is that 99% of Ataris lack the power to do anything sensible with a decent AVI file. Even the TT and Falcon owners (I have a TT) really don't have the power to do what even a cheap 486 based PC can do.

Roland.

The specific commands as provided by HiSoft's CPX module are basically just
write-protection of cartridges (ZIPs don't use hardware write-protect like
floppies) and being able to password-protect a volume.

: Good luck!
Thanks. The only good luck I had was that two of the partitions survived.
I backed those up, then repartitioned and zeroed it. I'm in the process of
retrieving a lot of those files from umich and others, wonderful archives.

However, I had Quickst, but the one in umich isn't the one I had, and it
screws up the desktop in low res. Anybody have a decent copy you'd be willing
to send me? Plus, I'm working with gulam, and I'm sure the cursor didn't
blink in the one that got away, is there some way to fix this? It's very
irritating.

This was an inherited computer, just recently, and so none of the files were
backed up, grrr. It's a 1040stfm, btw.

Cheers-

>I could not run it from a hard disk & when I eventually got it working
>from floppies, I could not save games.

I also had problems with using my hard drive and also with saving games. I have solved the "save" problem. I first formatted a disk at 10 sectors per track, resulting in just over 800K of storage space. Next, I deleted a file called "SAVE=B" which is in the BOOT.INF folder. I then moved a file called "SAVE=A" from the DRIVES folder and put it in the BOOT.INF folder. I have managed to save & load from the disk in DRIVE A.

>I agree about the game, it is impressive & if the above paoblems could be
>resolved, I would be interested in registering.

>BTW, ST Format (January I think) mentions more levels will be placed on a
>cover disk.

I am going to play this game a bit more but I think I have already decided I will send the author some bucks. Hopefully I will be able to get the new levels directly from him as buying ST Format here in Victoria is almost Mission: Impossible!

124. Experience w/ ZIP/Parallel Drive?

Does anyone know or have any experience with connecting and using
the Parallel Iomega ZIP drive on the ST line of machines (1040ST)? I
imagine that one would need a driver in order to use the Parallel version.
From what I understand, the parallel version is nothing more than a
parallel to scsi convertor -- as is written in a Linux x86 HOW-TO.

Source record: 153743

Hi all,

I have a Mega 2 st with 4 megs of memory that has some kind of problem that I just don't have the patience to weather. On occasion, when writing a file, and only when writing a file, the machine reboots. I've had it in for repair three times already and I give up with it. It doesn't do it all the time, one time out of 10 I'd guess, but in a music studio this is too much of a liability to me.

Maybe some technical minded person would like to take this off my hands or can use it for parts. Everything else works great. Make me a token offer.

Thanks,

Brian

> [...]
> In full internet, how can I get in all the resources that I have
> with my host connection?

If you get the TAF (Toronto Atari F[ound,eder]ation?) set of installation
discs, and if you can spare a 10 MB partition on your hard disc, you can
have a (somewhat minimalist, monochrome) un*x/X11 up and running in an
hour or two. Just do *exactly* what they say and it will work.

The TAF distribution includes telnet and ftp, I think I had to search
around a bit to find finger, lynx and pine. Chimera (graphical www
browser) is also included, but on a 4 MB machine it runs out of memory
as soon as it hits a 10 KB GIF file. :(

SFAIK Linux still requires you to have an FPU fitted. I'm now looking
into NetBSD, which doesn't. (The FPU doesn't cost much, but it's fiddly
to fit and my nearest shop is more than 400m away...). So that makes
three un*x clones available for the Falcon. None of them will quite
turn it into a SparcStation, but it's surprising what you *can* do.
Take a look at http://plato.digiweb.com/kiffer/ -everything you see
(and hear) was built, tested and uploaded using a Falcon and/or MegaST.

And all this is new to us!? Doesn't take a genius to know that PC's are slugs due to bad programming, and poor design. Doesn't change the fact that somehow, unfortunately, they are the standard. The machines aren't the PC's, Microsoft is the PC's, without Microsoft, the things might be half decent.

If you can't get any Atari stuff, then don't, get what you can.

>
>I just bought a Migraph scanner from Toad a few weeks ago. It came with
>TouchUp 1.84 and an Omron LightningScan scanner.
^^^^^^^^^^^^

And I thought Touch-Up was upto v2.51! Would those who have this new version confirm whether or not it will run under MagiC 2.x, a question I've failed to find the answer to despite asking a lot of people! I'm reluctant to spend an extra £35-00 on a package which I only generally use for scanning unless this is one of the benefits of the upgrade.

Andrew

144. BlowUp FX Installation?

Newsgroup: comp.sys.atari.st
Date: 1996-01-04 00:00:00 UTC
From: jperez@uhunix.uhcc.Hawaii.Edu
Message-ID: <DKo93K.7r8@news.hawaii.edu>
Source record: 153562

To anyone who has done an installation of the BlowUp FX accelerator for Falcon, can you offer some information as to how extensive the necessary modifications are? I am primarily interested in whether the process is easily reversible and/or removable. Does installation require cutting circuit traces? How much soldering is required? Etc... Any information is very much appreciated.

Aloha,

The Borg

146. *** WHAT CAN YOU USE YOUR FALCON FOR? CAN YOU BUY THINGS FOR IT?***

Newsgroup: comp.sys.atari.st
Date: 1996-01-04 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4ch1tf$d1h@huron.eel.ufl.edu>
Source record: 153564
Body handling: HTML body converted to readable text

What can you do with a Falcon 030?

The Falcon 030 was designed for true Multimedia Work. At this
moment this computer is no longer supported by Atari, it is now produced
by C-Lab of Germany.

In USA we have a few mail order companies that support and have
almost any thing you may need for your Atari ST, TT, or Falcon 030.
These are:

TOAD COMPUTERS 1-800-448-8623
e. mail: info@toad.net
WWW: http://www.toad.net/

ATY COMPUTER in California Ph. (510) 482-3775

if you want more information about products and sources you may
order ST INFORMER. It has many great articles and product reviews as well
as a list of suppliers of products for your Atari.

If you are looking for a computer that can do any type of serious
work being it desktop publishing, true color animation, 3D design, or
multitrack digital recording, the Falcon is here. I have done a lot of
productivity work with my set up. it is fun, fast, and economical. I
see my Falcon as a Graphics/Audio work Station, and it is!

Here are some of the things you can use your Falcon for:

Professional Multitrack AUDIO Digital Recording 50kHz
better than CD or DAT quality! with MIDI

Programs LOGIC AUDIO or CUBASE AUDIO

True Color Graphics, with Morphing,Animation, real time motion picture
video digitising. 24 bits graphics.

Program Apex Media and Expose Harware

YOU can do great desktop publishing work using:

Calamus SL, PAGESTREAM, ATARI WORKS etc

There are many good Terminal Communication Software

I use STalker and Steno

There are also many Retracing and 3D graphic programs available like:

CHRONOS PHOENIX and POV etc.

You can run any other programs like Data Base etc. and also add more
hard ware etc to your computer. example of these are:

Tabby Graphics Tablet and PEN
CD ROM Readers
SCSI Hard Disks
EXPOSE Video Digitiser and VIDEO MASTER FALCON
DAT to Falcon Digital Interface and Tape Backup
MODEMS
VIDEO CARDS
BLOWUP FX Card for more memory and speed!
Voice Mail capability etc.

As you can see there is plenty you can to your Falcon and plenty
that you can do with it.

There is only one thing you can not do. That is:

YOU CAN NOT WALK INTO YOU LOCAL COMPUTER STORE AND BUY SOFTWARE FOR YOUR
ATARI COMPUTER, But you can buy CD ROM, ZIP Drives, MODEMS etc. that can
be used on your Atari Falcon!

Well, ST, TT, MEGAS etc. are great too, but I only use a Falcon.

Hi hope this letter helps you understand why many people enjoy
having the Falcon computer and why it is a great buy.

I do not know the Game side of the Falcon. I use this computer for
professional work.

NOTICE: I am in no way related or affiliated to the above companies.

ICAL DATA I GOT FROM THE NET A WHILE AGO:

Atari Falcon030 Computer

Toad Computers: Atari Falcon030 Computer
Atari Falcon Price List

Falcon030, 1MB RAM, No Hard Disk$799.00
Falcon030, 4MB RAM, No Hard Disk$999.00
Falcon030, 4MB RAM, 85MB Hard Disk$1299.00 (Includes AtariWorks)
Falcon030, 14MB RAM, No Hard Disk$1499.00
Falcon030, 14MB RAM, 85MB Hard Disk$1899.00 (Includes AtariWorks)

Atari Falcon 030 Specifications

CPU: Motorola 68030 32-bit microprocessor @ 16MHz w/ 32-bit bus
FPU: Motorola 68881/68882 @ 16MHz (optional)

DSP: Motorola 56001 Digital Signal Processor running in parallel @ 32MHz
w/ 32kWords (24-bit) of local zero wait state static RAM
ROM: 512kB
RAM: 1, 4 or 16MB(14MB usable) on daughterboard (RAM is 32-bit wide)

Expansion bus: Internal 'Processor-Direct' slot for 386SX emulation
(third party 386SX emulator nearly completed) or other
co-processors/etc.

Video: (See below for specific video modes/resolutions.)
16-bit BLiTTER @ 16MHz (also handles hard drive access)
Accepts external video sync to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan support
Hardware-assisted horizontal fine scrolling
VIDEL (video controller) sits on 32-bit bus

Audio: Stereo 16-bit Analog-to-Digital DMA input
Stereo 16-bit Digital-to-Analog DMA output
Eight 16-bit audio DMA record/playback channels
SDMA sound/DMA co-processor

Ports: 128kB cartridge port
2 9-pin mouse/joystick ports
2 15-pin STe enhanced analog/digital controller ports (Atari also
has new analog controllers w/ a joystick, 3 fire buttons, and a
12-key keypad)
MIDI IN, OUT/THRU
Bi-directional parallel port
RS232C serial port
SCSI II w/ DMA
Analog RGB/VGA/composite video connector
Stereo headphone out (1/8" mini-jack)
Stereo microphone in (1/8" mini-jack)
DSP port (up to 1MHz data transfer rate)
RF modulator for TV hookup
Localtalk compatible LAN (up to 250kbaud transfer rate)

Misc: Internal 1.44MB 3.5" HD floppy
Internal IDE 2.5" hard drive (optional)
Pre-emptive mulitasking OS (MultiTOS) w/ adaptive prioritization
and inter-process communication (also 68040 compatible)
Realtime clock and battery backed up RAM
1040ST-style case w/ internal fan
North American availability in mid-October

Price: 1MB/no HD - $799 list
4MB/65MB - $1399 list

Resolutions available on the Atari Falcon030 (c) 1992 Atari Corp.
Written by John Townsend
==========

This document may be re-printed again and again as long as the Atari copyright remains intact.
==========

A couple of notes: Unlike previous machines, there are just too many resolutions to give each resolution a name. Therefore, I will do my best to describe what the resolution is and which monitor it is on.

- NOTE: TV and a Color Monitor are the same.. by Color Monitor, I am talking about the standard SC1224. By VGA, I mean a standard VGA Monitor.

40 column modes ("column" means the number of x pixels divided by 8)

4 color, normal, TV: 320x200, 4 colors, 2 planes
16 color, normal, TV: 320x200, 16 colors, 4 planes
256 color, normal, TV: 320x200, 256 colors, 8 planes
True color, normal, TV: 320x200, true color

4 color, interlace, TV: 320x400, 4 colors, 2 planes
16 color, interlace, TV: 320x400, 16 colors, 4 planes
256 color, interlace, TV: 320x400, 256 colors, 8 planes
True color, interlace, TV: 320x400, true color

4 color, normal, VGA: 320x480, 4 colors, 2 planes
16 color, normal, VGA: 320x480, 16 colors, 4 planes
256 color, normal, VGA: 320x480, 256 colors, 8 planes
True color, normal, VGA: 320x480, true color

4 color, line-doubling, VGA: 320x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 320x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 320x240, 256 colors, 8 planes
True color, line-doubling, VGA: 320x240, true color

80 column modes

2 color, normal, TV: 640x200, 2 colors, 1 plane
4 color, normal, TV: 640x200, 4 colors, 2 planes
16 color, normal, TV: 640x200, 16 colors, 4 planes
256 color, normal, TV: 640x200, 256 colors, 8 planes
True color, normal, TV: 640x200, true color

4 color, interlace, TV: 640x400, 4 colors, 2 planes
16 color, interlace, TV: 640x400, 16 colors, 4 planes
256 color, interlace, TV: 640x400, 256 colors, 8 planes
True color, interlace, TV: 640x400, true color

2 color, normal, VGA: 640x480, 2 colors, 1 plane
4 color, normal, VGA: 640x480, 4 colors, 2 planes
16 color, normal, VGA: 640x480, 16 colors, 4 planes
256 color, normal, VGA: 640x480, 256 colors, 8 planes

4 color, line-doubling, VGA: 640x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 640x240, 16 colors, 4 planes

256 color, line-doubling, VGA: 640x240, 256 colors, 8 planes

and lastly.. there are compability modes for ST Low, ST Medium, and ST High on both VGA monitors and SC1224 monitors. (On a color monitor, ST High is achieved by using the interlace mode).

Also, the ST Monochrome monitor (the SM124) will work with Falcon030 as well. However, it only supports one resolution: ST High Resolution.

All modes on a TV can be overscanned. This means multiplying the X and Y resolution by 1.2. For example, modes with 320 pixels of horizontal resolution (X res) will become 384 pixels across, and modes with 640 pixels will become 768 across. Overscanning is done in the X and Y resolution. You can't do them independently. Special Note: On a VGA monitor, overscan is "faked".. since the video hardware doesn't have the capability to do overscan on a VGA monitor, we made it so that if a overscan mode is set on a VGA monitor, you still see the normal size screen, but the screen is a window onto the bigger overscanned image. Make sense? We did this for compatibility. This way if a game that has an overscanned starup picture can use the same pic on both the VGA monitor and the TV monitor. Pretty cool, eh?

BTW.. Overscan can NOT be set from the desktop. The AES and Desktop will work just fine with it, but because you can't see the parts of the screen, we thought that that option shouldn't be available from the desktop. We don't want to confuse people. However, Overscan can be set using a new XBIOS call (Vsetmode()).. so it is still available.

I hope I haven't made any mistakes. I triple-checked this document in search of errors and I couldn't find any. If you do find some, send me Email on GEnie (to TOWNS) or CIS (70007,1135) and let me know.

-- John Townsend, Atari Corp.

P.S. Anyone who would like to reprint this message, please do so! The smaller the number of times I have to type that message, the more my fingers with thank you! ;-)

After looking at this one more time.. one point to clear up: By saying SC1224 Color Monitor, I mean any Color Monitor that Atari have manufactured for the ST/Mega/STE/MegaSTE computers. Clear as mud? ;-)

Lines: 470
In-Reply-To: kjohnson@castor.cs.uga.edu (Kristopher Johnson)

I found this file on the local ATARI Company's BBS : (original in Dutch)

This article is written by Wilfred Kilwinger (Support Manager) for Atari Briefing, the newsletter by Atari (Benelux) B.V. for the Atari user groups. It was specifically stated that it could be reproduced. I have
translated it in English with the assumption that an English translation would be considered the same as the original.

The original also contained a description of all the features of the Falcon
which have been reproduced here a zillion of times so I did not include these.

Atari custom chips

VIDEL

The VIDEL takes care of the video functions of the system including overscan, overlay mode and true color graphics

COMBEL

The COMBEL is the system manager of the Atari Falcon030. This chip controls
all system functions. Also the BLITTER is built in in this chip.

SDMA

The SDMA is the Sound DMA and controls the sound part. We have built in a unique matrix switch function in this chip (more details in the second part)

KEYBOARD PROCESSOR

The keyboard processor has been improved and is now also suitable for high resolution mice.

Besides the above custom chips the Atari Falcon030 has a number of standard
chips like the Motorola 68030 and 56001 DSP. Another important chip is the CODEC in which the 16 bit AD and DA converters are located.

Video modi

As you can see in the survey of Operating System calls
the video hardware is complete sotware controllable. The following combinations can a.o. be chosen:

Mode Resolution Bit planes Colors Palette

ST LOW 320x200 4 16 4096
ST MED 640x200 2 4 4096
ST HIGH 640x400 1 2 4096

True Color 640x480 8 256 262144
320x200 15bpp 32768 N/A

The last mode asks for some explanation. Here there is no color palette but
15 bits per pixel to describe the pixel itself. The format is RRRRRGGGGGXBBBBB. VDI supports this mode thus programs that have not been written for this mode specifically can use it nevertheless.
X is the overlay bit and can be used for video titling and special effects.

320x200 16bpp 65 N/A

This mode is called the slideshow mode, is not supported by the VDI, you are on you own. X is an extra green bit.

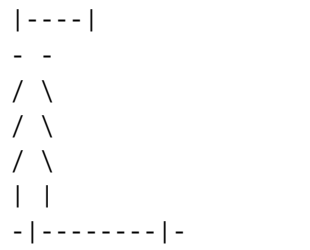
True Color in 640x480 is not possible because of the bandwidth of VGA monitors.

Mode Resolution Bit planes Colors Palette

VGA 320 of 640 1,4,8 2,16,256 262144 (Overscan
Video 200 of 400

With Video we mean the Atari SC-monitors, the TV modulator and/or the composite video output.

All modes can be gegenlocked. With adaptors we convert
the 15-pole video bus to thee standard Atari or VGA connections.



Matrix coupling

To make the system performance in the audio part as good as possible Atari designed a miniature 'telephone exchange' that can easily connect the source devices to the receiving devices. Also it is possible to make more than one connection at a time.

```

De volledige beschrijving van bovenstaande functie's staat in de Falcon030 Developers Documentation.

VIDEO SETMODE

```
int setmode( int modecode );
```

The setmode(int modecode) call is used to place the Falcon/030 SHIFTER into a specific mode. A bit-encoded value (called a "modecode") is passed to setmode() to set the mode. setmode() returns the previous mode that was set.

To help make the building of modecode values easier, here is a table of defines:

```
#define VERTFLAG 0x100
#define STMODES 0x80
#define OVERSCAN 0x40
#define PAL 0x20
#define VGA 0x10
#define TV 0x0

#define COL80 0x08
#define COL40 0x0
#define NUMCOLS 7

#define BPS16 4
#define BPS8 3
#define BPS4 2
#define BPS2 1
#define BPS1 0
```

Using these defines, you can build a modecode for any possible mode. For example:

For True Color Overscan:

```
modecode = OVERSCAN|COL40|BPS16;
```

For ST Medium Compatibility mode on a Color Monitor/TV:

```
modecode = STMODES|COL80|BPS2;
```

For ST Low Compatibility mode in PAL on a Color Monitor/TV:

```
modecode = STMODES|PAL|COL80|BPS2;
```

For 256 color, 80 column mode on a VGA monitor:
modecode = VGA|COL80|BPS8;

If you have a modecode and wish to know how many bits per pixel it
has, use the following:

if(modecode & NUMCOLS) == BPS16)
do_something_cool(); /* You have true color mode */

The setmode() call will return the previous modecode set. You must use
this value to get back to whatever mode you were in before you made your
setmode call.

int mon_type(void)

The mon_type() function will return the kind of monitor that is currently
in use. Here are the possible return values:

0 = ST monochrome monitor
1 = ST color monitor
2 = VGA monitor
3 = Television.

void ext_sync(int flag)

This function sets or clears external sync. If flag is set, external
sync is enabled. If flag is clear, then internal sync is used.

SOUND-calls

locksnd();
Used as a semiphore to lock the sound system. From other applications.

unlocksnd();
Used to release the sound system for other applications to use.

soundcmd(mode,data);
This command is used to get or set the following sound parameters.
If a negative number is used as the input then the current setting us
returned.

MODE OPERATION MEANING

O LTATTEN Sets the current left channel output

1 RTATTEN Sets the current right channel output

2 LTGAIN Sets the current left channel input gain.

3 RTGAIN Sets the current right channel input gain.

4 ADDERIN Set the output of the 16 bit signed adder to
receive it's input from the ADC, Matrix or
both.

5 ADCINPUT Set the input the the ADC. The input can either
be the left and right channel of the PSG or the

left and right channel of the microphone.

6 SETPRESCALE Used for compatability. This prescale value
is used when the DEVCONNECT() internal
prescale value is set to zero.

setbuffer(reg,begaddr,endaddr);
This function is used to set the play or record buffers. REG selects
playback or record, while begaddr and endaddr are the buffers beginning
and ending locations.

(int) reg - (0) Sets playback registers.
- (1) Sets record registers.
(long) begaddr - Sets the beginning address of the buffer.
(long) endaddr - Sets the ending address of the buffer.

setmode(mode);
This function is used to set record or playback mode. The modes are as
follows:

MODE OPERATION
(int) 0 8 Bit Stereo
(int) 1 16 Bit Stereo
(int) 2 8 Bit Mono

settracks(playtracks,rectracks);
This function is used to sets the number of record or playback tracks.

setmontracks(montrack);
This function is used to set the output of the internal speaker to one of
the four tracks currently playing. The internal speaker is only capable of
outputing ONE track at a time.

setinterrupt(src_inter,cause);
This function is used to set which interrupt that will occur at the end of
a
frame. If the frame repeat bit is on, this interrupt is used to allow for
double buffering the playing or recording of sound. Interrupts can come
from
TimerA or the MFP i7.

buffoper(mode);
This function is used to control the operation of the play or record
buffers
in the sound system. The input to this function is a bitmap. If mode is
set
t0 -1 then the current status of the buffer operation bits is returned.

NOTE: The sound system contains a 32 byte FIFO. When transferring data
to
the record buffer, software MUST check to see if the record enable (RE)
bit
was cleared by the hardware. If the bit was cleared then the FIFO is

flushed,
if not then software must flush the FIFO by clearing the record enable
(RE)
bit.

dsptristate(dspxmit,dsprec);
This function is used to tristate the DSP from the data matrix.

gpio(mode,data);
This is used to communicate over the General Purpose I/O on the DSP
connector.
Only the low order three bits are used. The rest are reserved. This call,
depending on the mode, can be used to set the direction of the I/O bits,
read
the bits, or write the bits.

devconnect(src,dst,srcclk,prescale,protocol);
This function is used to attach a source device to any of the destination
devices in the matrix. Given a source device, this call will attach that
one
source device to one or all of the destination devices. This call also
sets
up the source clock and prescaler, protocol and protocol source if used.

sndstatus(reset);
This function gets the current status of the codec.

buffptr(pointer);
This function returns the current position of the play and record data
buffer
pointers. These pointers indicate where the data is being read/written
within
the buffers themselves. This function is also used to determine how much
data has been written to the record buffer. See buffoper().

The above is not yet complete. Atari has also routines for
JPEG and andio conversion.

For anyone who hasn't seen the latest AEO, the Falcon appears to
have been design as a 24 bit computer, partly to maintain compatability
with existing software. This doesn't mean third party boards etc can't
extent that, but it explains the 14 meg memory limit. The other captures
from Jim Allen posts to GEnie say that the Falcon chips all seem to talk
at 16mhz. Another poster mentioned here that there's an 8bit processor to
dsp channel, I guess for uploading code into the dsp, though I don't
know if that means you can't tell the dsp to load a program from a memory
location itself, which would be faster, I'd guess.
Motorola says the top speed the 56001 is clocked at is 33mhz, so the
ad/da converters must be the parts clocked at 50mhz.

>second DMA/CODEC rate. This is the same as the STE/TT.

In the very techie "test" of the Falcon in the German C'T you can read a differend story:

"[external/internal clock, prescale 4-24 or 128]. Internally there is a 27.175MHz clock to select the for the STe known sampling rates of 12.5KHz, 25KHz and 50KHz, or 32MHz in order to use the full bandwidth of the memory transfer, with an sampling rate of 62.5KHz on eight 16bit channels. This is also the upper limit for the external clock."

(if the about dosn't make any sense then it is probaly because my german is even worth than my english)

> do.

That's not entirely true. The Falcon handles MPEG a LOT faster than the TT, because of the DSP. And .AVI isn't nearly as heavy in compression compared to MPEG, the reason why Dieter Fiebelkorn's AVI is so slow is because it only uses the 68030 and no DSP and because it's running in 256 (8-bit) colors bit-planed on TT and Falcon which slow.
If somebody coded a .AVI-player with Falcon-DSP support and running in Falcon High-Color (which is a chunky mode - faster) and/or support third party gfx-cards, it would be A LOT faster.
Believe me, the Falcon CAN handle .AVI-files power-wise, it's just that nobody has coded a decent Atari .AVI-player yet.

....And by the way, a Falcon with a 68040 (AfterBurner040-card) will be MORE than capable! A 68040 with a DSP56001 is quite an ace combination. Just ask Douglas Little from Black Scorpion :-)

Or use MiNT-net, which gets you access to ALL the programs the guy wanted.

> : - Is PPP really faster and better than SLIP?

> It is supposed to be more stable.

But STiK doesn't support PPP - it only supports SLIP, so you would then
HAVE to use MiNT-net. There are no disadvantages in using MiNT-net, except
that it's a little harder to set up initially. There's even a CAB.OVL overlay
that uses MiNT-net instead of CAB (nice one Dancer).

> : - What about Linux? Is there a simply way to install it?

> Yep, buy the CDROM (Atari Version) and then you can run the X-WINDOWS
> version of Netscape. Mind you, you will still need a pretty thorough

Actually, you cann't use Netscape, as it uses Motif, and Motif isn't
available for Linux68K. You can use Chimera (but then, you can run that
under MiNT & MiNT-X as well, and you don't need the rather drastic move
to Linux to do it).

Craig.

I posted an ad a couple of days ago and got alot of response but I guess I needed to add some more information. Well here it is:
Mega4 STe (Great Condition)
Color Monitor
Keyboard
120 Meg Quantum H/D
TOS 2.05
VIDI ST
Golden Image Hand Scanner
Extra 3 1/2 Drive (external)
Lots of software

I use to use this system in a DTP business I use to have so I have a lot of that kind of software also.
I am wanting to get no less than $500 for all of it. Do not want to split it up. I will consider any reasonable offer.

I'm looking for drivers for the Star LC-10II printer, black & white and/or colour models. (B/W is virtually the same as the NX-1000). Mainly just GDOS drivers. I know the standard FX-80 driver is fine, but if there's one that uses some of the more specific commands, then it'd obviously be better.

Where do I find GDOS printer drivers anyway? I can't find any on the usual FTP sites.

From: afn14016@freenet.ufl.edu
Message-ID: <4cf645$qid@huron.eel.ufl.edu>
Source record: 153573

I AM FAIR AND COMPAIR ATARI FALCON TO IBM!

Dear friends:

I like to take a moment to compare IBM to Atari, and do so in a fair maner.

My friend next door just got a Pentium. IBM Compatible Computers require a lot of hard ware because the operating system is really slow. as a result, to do any simple task on these machines you require more than 4 megs of memory and large hard drives plus expensive video cards . true or false?

Today it would be crazzy or impossible to run IBM compatibles without a hard drive. Could you run even just windows from a HD floppy. Of course not . True or false?

I just visited my friend next door who has a new Pentium. He was running a simple terminal program. this program is new and it is so simple that it did not have automatic dialing. I was very surpriced because I have an early version on STalker (which I am using now as I write to you) about 3 years old and the program has automatic dialing! Well, I asked about him having to dial every time manually, and he told me that this program was problably made like that because Compuserve has many lines and you can get on line on one try!

Besides every time the program dials it has to read and load a module from his hard drive and he has 8 megabites of RAM !. I find this stupid!

Well, the point that I am trying to make is that if IBM had a system as efficient as TOS GEM the machines would problably run ywice as fast with 1/3 of the resources. i am sure of this.

Also IBM users should notice that no matter how much RAM they have their machines have to read and write to the hard drive all the time.

Friends let me tell you this is poor programing at its best!

I am not a fanatic of any computer. an in fact had had the opportunity and some times not so enjoyable to work with MACs, IBM, Amiga and Ataris.

I can tell you that IBM are nice beacuse you get a very nice and colorfull interface, with neat animated icons and sound. You can get a lot of good programs and lots , lots of mediocre ones. You can go to the store and buy tons of software. But, really the machine does

not perform as should a computer that requires soo much Disk, RAM etc
For that reason I prefer TOS system as many MAC users are beginning
to appreciate. TOS is much better as and example:

You can run a realtime MIDI automated Notation Software
that includes automated MIXIN, SMPTE, multitrack
MIDI recording. You can run the TOS sys (in ROM) and this
professional software to score and record a whole Symphony
with ***** ONE MEGABITE OF RAM, FROM FLOPY!****

In fact you can LOAD THE PROGRAM FROM FLOPPY and then REMOVE IT
AND THE PROGRAM WILL ONLY NEED THE DRIVE TO SAVE YOUR SONG!
WITH NO HARD DRIVE!

I HVE THIS PROGRAM AND IS NOTATOR FROM C-LAB GERMANY

EVERY ONE KNOWS I AM WRITTING TRUTH

Most if not all GEM programs are this good and can run from a
regular floppy.

ATARIS ST are old and it is not fair to compare this to a 486
but really an atari ST with just a meg can do serious work using

CYBER PAINT and CALAMUS! (not Calamus SL)

An Atari with 4 Megs can RUN PageStream publishing with
outline fonts and color separation.

NOW WE GET TO THE FALCON 030. Price about $1200.00

The falcon is really an amazing machine. even people who have
Falcons do not know how powerful this machine really is.

You should know that the 030 processor is used only for simple
tasks. What really makes the Falcon a powerful system is really
the Motorola DSP and the 8 Digital to Analog Convertes that can
record Digital audio Multi Track at up to 50 kHz! Better than my
two SONY DAT.

The DSP can also be used for graphics and we have really
powerfull programs like

APEX MEDIA with EXPOSE to digitise true color motion video
at 25 frames per second!

Logic Audio can record on a Falcon multitrack * channels 50 kHz
Audio with the included hard ware.

LOOK at THIS 8 CHANNELS 50 kHZ DIGITAL RECORDING Hardware

MIDI PORTS
LAN PORTS
SCSI PORT
DSP PORT

MODEM PORT
TV OUT PORT!
SVGA Graphics

ALL OUT OF THE BOX NO NEED TO ADD CARDS AND MORE $$$$!

So just for the Digital recordind hardware and MIDI ports
THE ATARI FALCON IS AN INCGREDIBLE VALUE and BOY I THANK GOD for
IT!

So yes we have a problem, we do not have as much software, but if
you need some fantastic ones Atari has it and it works great!

SPEED. WE should not complain about speed. If you want more
speed, well add hardware just like IBM people HAVE TO

JUST YOUR TO LET YOU KNOW.

I took a CD ROM of animated true color FLI to the PENTIUM next
door and when we compared the playing speed of the Falcon using
the DSP and the Pentium It was the SAME!

By the way, I can play full screen, true color animations, full
speedwith digital stereo audio on my Falcon with the included
harware.

Every one shooses a computer for a good reason. I shoose the
Falcon because it is as I have said a good value and has power
If Falcon users wanted and IBM, they would save the money like
every one else and got one.

It is true we move slower when it comes to new software, because
we do not have Bill Gates in charge 9 nad maybe this is good!)
but I guess that is the price to pay for having ATARI.

Please don't let any one put down atari before they try one.
If youn have IBM,Amiga,or MAC enjoy it but remember

THE FALCON 030 IS A SERIOUS MACHIN- TRY IT and you can see.

And there is no other computer that I know of that right out of
the box can do Multi Track Digital Recording and Editing.

I just hope Atari had a better bussines sence!

PROGRAMS I LOVE TO USE:

LOGIC AUDIO
NOTATOR
PAGESTREAM DTP
APEX MEDIA
CALAMUS DTP
NEODESK
GENEVA
ATARI WORKS

and more!

NOTE: I have produced a CD "FRIENDS" that is being pressed in Canada. It was
Recorded on the Falcon 030 (45 minutes Stereo)
Also used this computer to produce color graphics cover and Program
notes,

It might be a lot better, yes - but that "Intel inside"... Hmmmm.

: :Anyone who is not using Windows NT or a similar non-MS-DOS reliant system
: :is really still fighting the 640k barrier. Most programs still want some
: :of that original 640k, and once it is gone, nothing else will run.
:
: true, but lets not forget that this 'backward compatibility' thing is what
: made ibm compatibles a reliable investment for companies and this is what
: made ibm compatibles the marketleader...
:
It's kind of tragical, I think: BUSINESS decided which system was to become the HOME COMPUTER STANDARD..... Very interesting chain of weird things, actually. It seems, we consumers wanted to turn our homes into offices? Otherwise PC would've remained at offices, and things like Amiga and Atari at homes. Something weird really happened here.

: :Programming, perhaps... Design, definitely. Apple, Commodore, and Atari
: :all abandoned their earlier platforms to make way for progress and more
: :powerful systems. It is tragic that the least sophisticated platform has
: :become the dominant one.
:
: again, being backward compatible is a STRONG point...

Backward compatible... Today's PCs..??? (manical laughter)
Well, it _was_ a strong point, but today... Nobody seems to care. Even Falcon is more backward compatible than a Pentium running Win-95 optimized

software or newest games. But then again: nobody seems to really care. Progress, they say. It's natural to buy a new PC every two years.. =(

:
: :
: :: EVERY ONE KNOWS I AM WRITTING TRUTH

Yes, you are - at least generally. We human beings just tend to be rather stupid in too many areas. We hit someone just because his skin has the "wrong" color. We buy something because all the other monkeys buy it. Sigh... Thinking about what happens around us every moment, it's no wonder people _want_ (!) to get themselves a home computer that _never_ was meant to become home computer. It's psychology, some deadly marketing skills (Atari never understood it), and some mindless buyer behavior without deep thinking.

A little time ago a friend of someone I know decided to hit his wife in front of all their friends, just because someone had drank his beer - and the wife didn't let this hero take their car to drive (drunk) to get more beer... Intelligent behavior at its best, and just an example of what goes on around us . =(Why shouldn't a bright fellow like that as well _love_ his Windows..? If it's okay to hit your wife, children and cats/dogs and drive drunk, isn't it okay to do almost anything - and tell yourself it's right?

Okay, sorry for moralistic nonsense - I've just experienced too much stupidity for comfort lately... ;-)

We may be the losing side, but at least I don't feel myself quite as stupid using Falcon as I would using Windows ;-)...

Have a Nice New Year, all of you!

Tommi

Unfortunately, due to my recent move, I haven't got anything with me to mail
you atm. Perhaps, if someone has the driver from the FontGDOS distribution
or something from Timeworks, you may find a solution.

Ha! I don't think we really differ, Tom. I agree that h/w compression works wonders for transfer rates. I tend to work out the matching of kit on the serial port based on rates for uncompressed (or uncompressible!) files.

I think I mentioned to the guy who enquired that the h/w mod would not really be much use unless he had a 28.8 modem (and ISP!)

The BJs I've known come with an LQ850 emulation so I've always gone for the Epson LQ driver (not with Pagestream as I don't have this but with all my other kit). Am I missing out on quality here? Or could it be that the Canon in question has its own native mode
only?

Hal!

It might only say 19200, John, but if the h/w and s/w (HSMODEM) is up to it
it will make a 38400 DTE. My kit does it every day :) I get 3200+bps on
already compressed files when connected to an equally capable
host.

(My kit = STM plus serial h/w mod, HSMODEM, Connect, Zoltrix
288)

Err... really 29633 Munster or Mï¿½nster (u Umlaut)?

In Munster there is hardly anything at all, besides the army.

Mï¿½nster, OTOH, is the name of several villages in Germany (it translates
to "minster"), the biggest of those is well-known for having a university
and being the location of the first MAUS BBS.

I agree with the vast majority of what you
say.

The IBM hardware architecture is very old and forces the most dreadful constraints on the s/w. The marketing solution is to use faster processors, larger stores and larger HD. This will work for so long but no further.

We all know what the answer is - the PC community should throw it all away and start again. Easier said than done, though, when you have spent a fortune persuading the market that they will be safe with PC architecture boxes.

Luckily, we, as hobbyists, can take the more rational decision to use machines which have a sensible architecture which makes efficient software possible.

Forget PCs!! You may be forced to use one as part of your work but that's
life
:(

>Link-II, by the sounds of it it works on the Mk. 2, but not Mk. 1!?)

Nope, no real way to do it unless you are an electronics wizard, it has no switches or jumpers or anything to disable the parity. I had to upgrade my Link to V2 before I could get my Zip up and running.

>Also, can I use it _instead_ of a hard-disk? (I.e., my _only_
>high-capacity storage device?)

Yep but due to either the use of 25 pin cables or the PSU not supplying enough power for the Link & Termination (Conflicting reports on which one is correct) you will also need a lead to pull power from another source (eg joystick port).

>My understanding is that I need to
>disable parity (surely the link would do this automatically, as this has
>always been necessary...)

If you could dissable parity it would work but the Link 1 does not support parity, parity is only settable by either Jumpers or on very few devices by software on a platform that supports it. Unfortuntely in Iomegas infinite "there are only PCs & Macs" wisdom failed to allow for the parity checking to be disabled.

>but FWIH only the Link-II gives you an option
>to do this.

The Link 2 can simply use parity checking which some devices need, ICD used cheaper chips in V1 and so this feature was not available.

>I can't really afford to upgrade to the Link-II, as the
>only reason I'm getting a ZIP-drive (far below normal market price of

Bad luck i'm afraid, don't forget that selling your Link 2nd hand can fetch a fair few quid and you might be able to pick up a 2nd hand Link 2. I Sold mine and bought a new one, that was 30UKP to upgrade, if you can buy a 2nd hand Link 2 then you might be able to do it for next to nothing.

185. TT030 Cartidge Port malfunction - help! How to fix?

Newsgroup: comp.sys.atari.st
Date: 1996-01-04 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4cg0jr$33o@status.gen.nz>
Source record: 153641
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,maus.sys.atari.talk,fr.comp.sys.atari

Recently, our TT030 cartidge port has stopped working.
I had the Robokit cartridge in the port. I don't know if it is related to this (it can't be really) but as I was putting a wire into one of the connectors (the wire did not connect to anything else), I heard the internal hard drive initializing itself, like it does after spinning up. Wondering what had happened, I went to move the mouse, but it was frozen. I tried to re-boot the computer from the keyboard, but it did not respond. After pressing the reset button, the monitor came up with horizontal bands ranging from white to black rolling vertically. I turned the computer off.

After turning it back on, everything seemed normal,
except that the Robokit acted as though inputs 3,4,5,7 were on, even when none were on. I took out the robokit cartidge, but even with it out it acted in the same way. Seems that the presence of the actual cartridge has no effect.

I tried using the Migraph handscanner, but Touchup just reported that no scanner interface was present.

So, it seems that something has damaged the cartridge port. It would seem at first glance that it was something I did to the robokit which caused the problem, as the problem showed itself while I was attaching a wire to the robokit. But what harm could that have done? (I have used the robokit for some time and know what I am doing.)

Does anyone understand anything about this? What is likely to be damaged? What is the likely cause of such symptoms? Am I right in thinking that perhaps some driver IC for the cartidge port has become damaged, and replacing it might fix the problem? I have some spare ST motherboards, in case some components from there might help fix the problem. Any ideas?

The cartridge port is NOT buffered and connects directly to the data and address
buss. If the operation of the TT is correct then the address and data lines are
OK. The only connections specific to the port are pins 37,35,33 and 31 which are
connected to the TTMCU (U206). The cartridge port is supplied with VCC (+5v)
on pins 1 and 2 via a fuse rated at 5 amps (F61), I would start by checking
if this voltage is availiable.

email if you require further info or help.

187. ZIP Drives/ICD Link

Newsgroup: comp.sys.atari.st
Date: 1996-01-04 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DKn7rr.MMr@actrix.gen.nz>
Source record: 153643
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Question time again... :)

Can I use an IOmega ZIP-Drive on my STe with an ICD-Link? (Link, NOT Link-II, by the sounds of it it works on the Mk. 2, but not Mk. 1!?)

Also, can I use it _instead_ of a hard-disk? (I.e., my _only_ high-capacity storage device?) My understanding is that I need to disable parity (surely the link would do this automatically, as this has always been necessary...), but FWIH only the Link-II gives you an option to do this. I can't really afford to upgrade to the Link-II, as the only reason I'm getting a ZIP-drive (far below normal market price of course) is that I just happen to have the ICD-Link laying around.

Do you still have 5V at pins 1 & 2 on the cartridge port?

If not check fuse FS1 (5A).

The data and address lines are not buffered.

If it _is_ a MS-format file, then you'll need at least a 100Mhz machine
to be able to view it at the same speed a Falcon will decode a JPEG. MS
- If it's not slow enough, they'll soon fix the problem!

Pagestream, which is one of the most demanding of Atari programs, is miniscule compared to the mammoth requirements of, for example, Word Perfect 6.1 (12meg Ram, 30meg hard disk space).

: NOW WE GET TO THE FALCON 030. Price about $1200.00

: The falcon is really an amazing machine. even people who have
: Falcons do not know how powerful this machine really is.

: You should know that the 030 processor is used only for simple
: tasks. What really makes the Falcon a powerful system is really
: the Motorola DSP and the 8 Digital to Analog Convertes that can
: record Digital audio Multi Track at up to 50 kHz! Better than my
: two SONY DAT.
: The DSP can also be used for graphics and we have really
: powerfull programs like
: APEX MEDIA with EXPOSE to digitise true color motion video
: at 25 frames per second!
: Logic Audio can record on a Falcon multitrack * channels 50 kHz
: Audio with the included hard ware.

: LOOK at THIS 8 CHANNELS 50 kHZ DIGITAL RECORDING Hardware
: MIDI PORTS
: LAN PORTS
: SCSI PORT
: DSP PORT
: MODEM PORT
: TV OUT PORT!
: SVGA Graphics

: ALL OUT OF THE BOX NO NEED TO ADD CARDS AND MORE $$$$!
: So just for the Digital recordind hardware and MIDI ports
: THE ATARI FALCON IS AN INCGREDIBLE VALUE and BOY I THANK GOD for
: IT!

: So yes we have a problem, we do not have as much software, but if
: you need some fantastic ones Atari has it and it works great!

: SPEED. WE should not complain about speed. If you want more
: speed, well add hardware just like IBM people HAVE TO

: JUST YOUR TO LET YOU KNOW.

: I took a CD ROM of animated true color FLI to the PENTIUM next
: door and when we compared the playing speed of the Falcon using
: the DSP and the Pentium It was the SAME!

: By the way, I can play full screen, true color animations, full
: speedwith digital stereo audio on my Falcon with the included

: harware.

: Every one shooses a computer for a good reason. I shoose the
: Falcon because it is as I have said a good value and has power
: If Falcon users wanted and IBM, they would save the money like
: every one else and got one.

: It is true we move slower when it comes to new software, because
: we do not have Bill Gates in charge 9 nad maybe this is good!)
: but I guess that is the price to pay for having ATARI.

: Please don't let any one put down atari before they try one.
: If youn have IBM,Amiga,or MAC enjoy it but remember

: THE FALCON 030 IS A SERIOUS MACHIN- TRY IT and you can see.

: And there is no other computer that I know of that right out of
: the box can do Multi Track Digital Recording and Editing.

: I just hope Atari had a better bussines sence!

: PROGRAMS I LOVE TO USE:

: LOGIC AUDIO
: NOTATOR
: PAGESTREAM DTP
: APEX MEDIA
: CALAMUS DTP
: NEODESK
: GENEVA
: ATARI WORKS
: and more!

: NOTE: I have produced a CD "FRIENDS" that is being pressed in Canada. It was
: Recorded on the Falcon 030 (45 minutes Stereo)
: Also used this computer to produce color graphics cover and Program
: notes,

The Falcon is an incredible computer, and I am very pleased with mine. I can't really blame Atari though, because although they have displayed questionable judgement, they never really had the resources to make the Falcon fly. I can, on the other hand, have great contempt for Bill Gates, Microsoft, and Intel. They are responsible for making sure that the computer industry is ten years behind where it should be. It is understanable that a small company like Atari might make mistakes or release a less than perfect operating system or hardware, but corporations such as Intel and Microsoft have all the resources in the world, any they know how to get the most money out of us - keep us disatisfied!
I hope that C-Lab and/or Wizztronics can carry on the Atari Computer legacy, by continuing to create an support computers that work well, and that are designed to meet the needs of the users, rather than those of the greedy corporate heads. I would love for someone to hahve

made billions from Atari computers, but only because we would know that the consumers had gotten their money's worth.

At work I have a 486-DX4/100 with Windows NT, and a Powermac PPC601/66 - but the only machine that really does what I want, need, and expect, is my Falcon.

>configuration file.

I seem to remember having to download a patch program, which modified the Gulam executable. I'm not sure where you'd find it and I don't remember what the name of the file was (although it was something fairly obvious), but I think I got it from HENSA.

>I did however have a look at a file called "gulam.hlp", but I have no
>idea where it should be placed or anything. Any ideas?

You need to set the variable "gulam_help_file" to the full pathname of the help file. There's a full reference manual available (probably from the same place as the patch file) in TeXinfo format. It details all the built-in commands and special variables.

>The second problem, though not as critical as the above is that the mouse

>the mouse pointer disappears, but the mouse still messes up the commands if
>I move it (so why move it?- well, it starts moving on it's own at times,
>and until I get a proper mouse it's very irritating).

I don't of any way around this one, sorry. Maybe turning your mouse upside down?

>I'm also wondering how the shell could be installed within my system, so
>that it can be called upon from other programs- I see that in some menues
>there's a "start shell". Do I set this in the "environment" variables?
>Something like: set shell= d:\system\shells\gulam\gu.prg ?

That would be my guess. It really depends on what the other programs are looking for, but what you suggest seems quite reasonable.

>Finally, how do I add more commands to it? I miss several commands, like
>"more" (yes, I know Uemacs replaces this for now, but I'd like a plain
>"more" instead), "less", "tail" and a few others. Are these added by having
>.TTP programs for the commands? Where can I find them? I'd like to have a
>complete as shell as I can have, getting as close to the tcsh shell I'm
>using in unix.

You could actually run tcsh itself, but Gulam was always my shell of choice as it took up very little memory and had a decent editor built in. Gulam has its own PATH variable, and any .ttp, .tos or .prg programs (or .g Gulam

scripts) in the path can be run as if they were built-in commands.

The HELP key lists all the built-ins and the external commands which Gulam knows about. If you copy any .ttp programs into a directory in your path while within Gulam, you will need to use "rehash" to rebuild the hash table so you can start using those programs straight away. Also, if you get hold of your own more.ttp, you may have to use an "alias" command in gulam.g to bypass Gulam's own internal "more".

Anything calling itself "Unix commands" or "Unix utilities" will probably contain a bunch of suitable programs. Atari Archive has the GNU file, text and shell utilities, if I remember correctly, but some of them crash or misbehave unless you use "fixstk" (part of a standard GCC installation) on them to give them an internal stack greater than 0K.

I have connected a normal SCSI Zip drive up to an STe along with a cd rom
and it works just fine.
I am not familiar with a 'parallel' Zip drive 'though.

And does not a Falcon of that specification fall into the 1% that *can*
do this? I think so. I stand firm with my statement. 99% of *all* Ataris
out there do not have the power to do what even a cheap 486 based PC can do.

However - I will admit - a 486 PC needs more support hardware than the
Falcon. On its own - it has trouble competing with the DSP. OTOH the sort
of I/O cards needed to do AV on the PC are rapidly falling in price. Also
cheap PCs now have DX2 and DX4 processors running at anything up to 120Mhz
internally. The external local bus speed can be easily 33Mhz. This sort
of raw power makes up a lot for the lack of a DSP chip.

Don't get me wrong - the Falcon is a good bit of kit - but in its standard
configuration it is certainly underpowered for AV work.

:-)

Of course - under Windows you can just turn the VM off. This way - if you really *do* have enough RAM - then the machine doesn't access the hard disk at all - apart from when it is dealing with proper files.

> APEX MEDIA with EXPOSE to digitise true color motion video
> at 25 frames per second!

Just out of interest - what resolution and colour depth can this be done at (full 25f/s)? Also in terms of harddisk space - how much per second and is there any compression involved?

> SVGA Graphics
>
> ALL OUT OF THE BOX NO NEED TO ADD CARDS AND MORE $$$$!

SVGA graphics? I supose as far as colour goes it might be. The standard Falcon resolution is nothing to write home about IMHO however.

> THE ATARI FALCON IS AN INCGREDIBLE VALUE and BOY I THANK GOD for

So you are not even a little bit fanatical? ;-)

> So yes we have a problem, we do not have as much software, but if
> you need some fantastic ones Atari has it and it works great!

Like to help here - but the whole argument really revolves around the DSP chip. I'm sure glad Atari put that in too - as without it - the Falcon would just be a slow TT. Being a TT owner I can saftly say that it isn't overwhelmed by power. The TT has lots of nice features - and I'm sure glad I bought one - but not really suitable for AV work.

BTW in case anybody cares - the ROMBO VidiST-12 *does* work just fine with a TT. There is nothing in the box or manual about TTs - but it seems to work all the same.

:-)

This really begs the question that if the PC spent its time decoding a JPEG instead of a AVI file - then maybe the Falcon wouldn't appear quite so fast against it.

>

If you do not want to upgrade to a Link II then I don't really think
the IOmega Zip is what you want to be looking at, especially if it is
to be the only device you have connected as you will run into both
parity and power problems... the Syquest EZDrive however will work quite
happily with a regular Link (One).

I suppose it depends on the price of those where you are though and
how much of a deal you could get on the IOmega... And don't take my word
as Gods honest' as I HAVEN'T actually tried the Link/Iomega combo myself,
just what I have heard from ICD and others when I was thinking of the same
solution to my storage problems, in the end I just got the Link II though.

Later...

I'd look for 74 type chips near the cartridge port. Failing that - try tracing the data tracks from the connector. Hoefully these are the ones which you I/O cartridge are using - and hopefully they terminate at some easily replaced chips.

Failing that - its going to be a workshop repair unfortunatly :-(

Hi,
on an Mega STe you will have to use Modem2 or Serial2 to get the higher rates. Modem1 only supports 19200 (hardware restricted). You can however also extend this rate with some hardware modifications. There again refer to the HSModa Docs for the required update.

I have it on good authority that although you can get a Zip drive to function with the ST/Link, it requires specific drivers from ICD and may still have difficulties. The Syquest EZ-drive is faster, has larger cartridges (135meg) and will function more or less as a regular hard disk drive. It comes highly recommended from several Atari users that I know of. Now if only Syquest made a 600meg removable...

Its unlikely to work as the Atari parallel port doesn't have all the lines connected that PC type devices require. The only way I've ever seen this done is by building another parallel port on the Atari cartridge port. This is how it is possible to connect the D-Link DE600 ethernet adaptor to an Atari.

Even if these hardware problems can be solved - as there is already a SCSI version - its unlikely that anybody is going to spend much time trying to write a driver.

> version. From what I understand, the parallel version is nothing more
> than a parallel to scsi convertor -- as is written in a Linux x86

Hmm - I wouldn't have thought they would have built it like this. Seems rather expensive. However if it really is as clear cut as this - then your best bet would be to try and bring the SCSI bus out of the ZIP so that can connect it directly to an Atari SCSI host adaptor. However I wouldn't really recomend this. Its likely to get very messy.

:-(

YES! It would be very nice ...

However I fear the Falcon is only able to do these things because of the
DSP chip. Take the DSP chip away - and the Falcon is very underpowered.

Anybody do an AVI viewer for a TT?

:-)

: modifications are? I am primarily interested in whether the process is
: easily reversible and/or removable. Does installation require cutting
: circuit traces? How much soldering is required? Etc... Any information
: is very much appreciated.

If you're a somewhat experienced soldering iron -user, there should be no overwhelming problems.

RAM expansion is very easy to install: no soldering at all.

Blow-Up graphics extender requires only one wire to be soldered. Unfortunately, this wire goes to a nasty place under the motherboard. Lots of work removing the motherboard, but nothing really difficult if you're careful and patient...

DSP-speeder is the toughest bit, I think. Only one wire again, but what a wire! In order to succeed, one has to be EXTREMELY careful - now we talk about tiny things to handle. But... It's not exactly difficult. Just frustratingly time consuming. Patience, stabile hands, good eyes..

The CPU/FPU-speeder is a mess with pretty lots of soldering and cutting wires (fortunately, not any motherboard-wires IIRC). Lots of work, and again (surprise) one has to be careful. It's pretty straight-forward, and not very difficult. The hardest part will be after the installation, if you have to make some extra modifications (many Falcons require this to handle 36..40 MHz). That part is a nasty one, if not (again) too difficult. Work, work, work and work.

It can be done =) !

And it definitely is worth doing..

Greetings,
Tommi

217. A Quick survey

I'm just interested in how many people have a:

4 Mb Falcon030 with a
Dual speed or higher CD ROM fitted

There does seem to be a lot of Falcon owners out there - but do they have CD-ROMs !

I'd rather you email me if you do but I should be able to check further postings
...

Thanks for your help :-)

I'd have to disagree, the main speed factor with MPEG video is memory bandwidth
and the Falcon just doesn't have enough! Sure the DSP can help with certain
parts of the decoding process, but the bandwidth bottleneck hits you in the end.

220. *** CAN THE FALCON 030 DO MULTIMEDIA WORK? *****

Newsgroup: comp.sys.atari.st
Date: 1996-01-05 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4cici5$oh9@huron.eel.ufl.edu>
Source record: 153476

Hi Friends:

I am very pleased with your interest on the Falcon articles.

I write about the Falcon because that is the computer I have and
like. I am not qualified to write about the TT because I have never
used one.

I am not interested in proving which computer is the fastest. I am
however intersted in hearing from users and telling atari users that
the Falcon 030 is a very good choice.

I would like to tell you that I am convinced that this computer has
plenty of power to do multimedia work and do it very well.

I had the question myself about it being able to do the job. So I
came up with the following trick and experiment which I believe
proves the point.

If you follow this experiment you will have a

FALCON PLAYINFG FULL SCREEN TRUE COLOR ANIMATIONS AND AUDIO
SIMULTANEOUSLY AT FULL SPEED SMOOTHLY!

This method was published on ST Informer # 95 and was written by me

You can play the audio and FLI/FLH animations from the desktop
or from withing APEX media at full speed with no ploblems or
glitches.

You can change resolutions from the desktop or from Apex
load animations from disk and the audio will keep going
also when changing resolution, the screen will go dark
and the audio will keep going smootly.

So, If you can play true color, full screen animations with
quality stereo digital Audio, it is evident that the Falcon
is a Multimedia computer and has the potential to do
professional work with Expose and Apex Media.

I just had the oportunity to see some digitised video played
from the Falcon to TV and it looked like TV broadcast

BELIEVE IT or NOT!

So here is the experiment. try it it works.
NOTE: Make sure you load patch2.prg from the auto folder.

You can play your samples from within any application by assigning them to any key of your computer keyboard . Once you load the program you want to work with, the sample is played by pressing any key you assigned a sample to. For example, the down arrow key is used in Apex Media to start the animations so I assign a sound track to this key to start the sample in synch with the animation.

To assign a digital sound sample to a key follow these steps:

1-Enhable the SAM.PRG that should be in your AUTO Folder and also the SAMFIG.ACC on the root directory and reboot your computer.
2-Call the SAM Setup ACC and click on Extras. (IMG 1)
3-Select "Define Keys"
4-Select "New key Set" and name the key set. (IMG 2)
5-Press the key you want to assign the sample to (for this example you could use the number 1 key on the numeric pad on the right of the keyboard) and click the mouse button.
6-Now you will see the name of your key set on the "Current Key Sets" window
7-Click OK

NOTE: You can create any number of sets containing one or more keys, but to stay simple just define a set with one key for now.

8-Scroll the System Events Window to find the set you just created and select it. (IMG 1)
9- Assign the Sample by selecting it from the "Sound Assignment window, click OK

SAM may need to reconfigure the memory buffer and you may need to reboot your computer for the samples to be activated. Use the built in Recording feature to record your own new samples.

Please read the instructions on the Atari System Audio Manager manual for more details on using SAM.

Once you EXIT the SAM Setup Acc. you will be able to play the samples by pressing the keys you assigned the samples to. You can play this samples from within any program. If northing happens make sure that the sound buffer is sized correctly and make sure that you rebooted your computer.

Load Apex Media and load a FLI/FLH animation and press your sample Key. Surprise! You have got Sound and Video. Your Falcon is a great machine!

Also you can play another sample on the fly. Try it, works very smoothly. I have played samples 1 minute long and even changed resolutions and the sample kept going without a glitch.

If you own the Neodesk Desktop you can do some really neat things using macros. For example you can Install a FLIC player program as an application and then define a macro by clicking on the Menu Item Begin Macro . Then double click a FIIC file to play it, after the animation is over click on END Macro and assign the Macro to a key. If you assigned a sample to this key, next time

you play the macro using that key both the animation and sample will play at once.

I hope you find this tips fun and helpful.

Please read the instructions on the Atari System Audio Manager manual for more details on using SAM.

Once you EXIT the SAM Setup Acc. you will be able to play the samples by pressing the keys you assigned the samples to. You can play this samples from within any program. If northing happens make sure that the sound buffer is sized correctly and make sure that you rebooted your computer.

Load Apex Media and load a FLI/FLH animation and press your sample Key. Surprise! You have got Sound and Video. Your Falcon is a great machine!

Also you can play another sample on the fly. Try it, works very smoothly. I have played samples 1 minute long and even changed resolutions and the sample kept going without a glitch.

If you own the Neodesk Desktop you can do some really neat things using macros. For example you can Install a FLIC player program as an application and then define a macro by clicking on the

Menu Item Begin Macro . Then double click a FIIC file to
play it, after the animation is over click on END Macro and
assign the Macro to a key. If you assigned a sample to this
key, next time you play the macro using that key both the
animation and sample will play at once.

If the Falcon can do this in multitasking mode, it would perfom
very well with a dedicated AV player.

I got some news of a new update of APEX to APEX 3 with AUDIO!

IS THIS FOR REAL? THIS WOULD BE THE FINAL ANSWER!

I hope you find this tips fun and helpful.

Hello All,
An e-mail group devoted to Pagestream operation has now formed.
The purpose of the group is to share information about the program and to
have a collection of people available to help solve problems related to
the program.
The group currently has 15 members. If you would like to be
added to the address header of those in the group, please personally
e-mail me the following information. It will be added to the data base
of users currently in the group and made available to all the group members.

Information requested:

your name
geographical location
e-mail address
Pagestream version used
computer(s) used
printer(s) used

Please do not include the question in your response, but just the
answers, such as this:

Walter Hellman
Hillsboro, Oregon U.S.A.
hellman@teleport.com
2.2b
STE (4 meg)
Star Laserprinter 4 Starscript (postscript clone)

All Pagestream users are welcome to join this group!

Source record: 153481

Thanks for that information......I've kind of been meaning to do that for a while now!

However........is there any easy way of putting my Falcon030 motherboard into a standard PC tower case - with bigger PSU? Because, if this can be done, then I'll be more inclined to get a very large HDD and a CD-ROM to go in the drive bays. (Has anybody got any experience of this?)

Also, what is FX graphics card (?) for??? I've seen some Atarians on the net have these, but I've been moving house, and changing ISP etc, and I seem to have missed some developments during the last 4 weeks!

TIA

Simon

: > even dream of... So why not AVI-files, too?
:
: And does not a Falcon of that specification fall into the 1% that *can*
: do this? I think so. I stand firm with my statement. 99% of *all* Ataris
: out there do not have the power to do what even a cheap 486 based PC can do.

In a way I agree with you, but then again: a 486-33 running even modern word processors is a nightmare, not to mention DTP programs. At least, equipped with 4 MB of RAM. An ancient Mega-ST runs quite well both Papyrus WP, and even the hideously big Calamus SL. PC has the raw power - but without a decent operating system little is left.. =(

: However - I will admit - a 486 PC needs more support hardware than the
: Falcon. On its own - it has trouble competing with the DSP. OTOH the sort
: of I/O cards needed to do AV on the PC are rapidly falling in price. Also
: cheap PCs now have DX2 and DX4 processors running at anything up to 120Mhz
: internally. The external local bus speed can be easily 33Mhz. This sort
: of raw power makes up a lot for the lack of a DSP chip.

Raw power... Yes. This reminds me of a truck. A huge V12 turbocharged engine with loads of horsepower. The raw power is there, no doubt. But since it has to pull a weight of an eighteen wheeler..... No speed records here =) ! Falcon might have the much smaller engine - but the car is much lighter, too. Though some may disagree, I think this comparison is fairly good. It's the only way to explain why Amiga 1200 and Falcon can handle DTP, where 10 times more powerful PCs and Macs have trouble. Design..!

: Don't get me wrong - the Falcon is a good bit of kit - but in its standard
: configuration it is certainly underpowered for AV work.

Depends on what kind of AV work you're planning to do... Apex Media package, e.g. is well able to do serious AV work, even on a standard Falcon. DSP is the

key word here. Without its DSP, Falcon really is seriously underpowered, even with its fast operating system (compared to Windows or MacOS), I agree there.

Just yesterday I compared some MPEG-files between my friend's 486DX4-120-8, and
my Falcon 030 (currently 36/50 MHz, 8 MB RAM). My Falcon achieved somewhat
higher frame rates, though the difference mostly wasn't big. One MPEG flying
at 29 FPS on Falcon only achieved 20 FPS on 486-120. My Falcon's memory band-
with is a bit better than that of a standard Falcon, but the conclusion seems
to be clear though: Falcon performed better in a real-life situation.

P.S - we tried to make the situations (graphics, etc.) identical, but one
can never draw very deep conclusions from tests like this.

Tommi

From: agoold@cix.compulink.co.uk
Message-ID: <DKq1xz.KHx@cix.compulink.co.uk>
Source record: 153485

It is proposed to start a new Atari User Group based in the West of Scotland. It will be affiliated to The UK Association of Atari User Groups. The intention is to hold meetings, on a monthly, or 4 weekly basis. It is anticipated that the inaugural meeting will take place on 20th February 1996, probably in Howwood, Renfrewshire.

It is also hoped that the User group will run either a monthly or bi-monthly newsletter for it's members. The initial Newsletter is in preparation at the moment, so if you want this please mail me and I'll give you an address to send a large SAE to.

It's aim is to provide support for, and to foster communication between, Atari Computer owners in the West of Scotland, to provide timely information about Atari news, products, vendors, and service, and to find solitary Atari computer owners and encourage them to join the group.

The group will be open to all Atarians or former Atarians regardless of experience or equipment.

The W.S.A.U.G. will be a non profit making group and will be affiliated to The Association of Atari User Groups.

All enquiries should be sent either by e-mail to :-

agoold@cix.compulink.co.uk

The PTC1426 is a monitor, not a computer or system. Mostly it is
just a VGA monitor, although it has a little switch on the back to
increase the width (height?) when using an Atari TT030 computer with
it, which is what it was built and sold for.

Nope wrong guess! I have an Adscsi+ and power supply in the case
with the 105M Syquest and the 85M Seagate! You are right in that I have
an STe w/AdspeedSTe!

Hello Atarians.

Does anyone have the TOS-file needed for STonX the Atari ST emulator for linux? Could you please mail it to me or perhapps post it to alt.binaries.misc?

I really would like to revive some of the old memories of my ST using days.

Thanx

/Max

235. Please advise on adding EZDrive

Newsgroup: comp.sys.atari.st
Date: 1996-01-05 00:00:00 UTC
From: mfeaver@s3.sonnet.com
Message-ID: <4ck4m7$514@sonnet1.sonnet.com>
Source record: 153491

Hi folks!

Would appreciate detailed info on adding a
Syquest EZDrive to my old AtariST. It is
a 1986 model with original TOS in Rom. I
understand I will need an ICD Link II, but
have no idea what this unit/cable looks like
or how it connects to the EZDrive. I know
it must plug into the DMA port. As I only
have floppies on the computer, I want to
use the EZDrive as a removeable Harddrive
and swap it back and forth with my PC. I
want to move files (.mid) from the PC to
my Atari for working with midi, and also
want to do away with the tons of floppies
for the Atari. I will have to mail order
items, and would like to know what I need
to get the job done the first time!

I see Toad Computers has the ICD for $90
do I need additional software or drivers?
and how is the software installed, I know
this sounds dumb, but I've never installed
any hardware requiring special drivers.

Will the EZDrive which I have to get also,
just plug into the ICD Link, or do I need
special cables or different connectors
than what come with the ICD or EZDrive?

All info you can give will be sincerely
appreciated. You can email me or post
to the group which I read every day.

Thanks in advance.

Mark Feaver mfeaver@s3.sonnet.com Stockton, CA USA

PS My brother in S.Calif. just got the EZDrive and had to
get a special $50 scsi cable to go to his qlogic scsi
host adapter in his PC. He also has an Atari, and I am
researching for both of us! Thanks.

Yes this had me pulling my hair out as well.
All i did was to leave the whole thing alone, the pages will appear but it
took ages, i'm sure early versions were much faster than this latest one.
Don't be put of if the page is all grey just leave things as they are and wait.

>from U.K.).

Why?
Buy an Atari ST/Falcon if you like the operating system and the
software it runs.
No fancy show-off stuff, but it does it's thing well and fast- and
most of all- is *easy* to use and logically laid out, unlike a certain
graphical operating system for PCs.

Buy an Atari if you don't want to blidly follow the Micro$oft crowd
and pay several times the amount the software packages are worth, only
to find out a little later that you need an upgrade, and in
order to upgrade you need to "upgrade" your machine as well (i.e.
trash your existing investment and get a brand new top-of-the-line
machine needed to run the newer, better operating system which is of
course needed for the upgrade of the program as well).

Buy an Atari if you don't want to spend half the day pressing the
reset button, messing around with configuration files, calling up the
customer dept. at micro$loth or whatever since nothing seems to
work... and get your work done on the Atari instead!

Buy an Atari because you don't want to wait for xxx (fill in the time
according to which version of Windozzzzze you have) to load (and crash
again). And where you need loads of memory and harddisk space just to
get the computer up and running (while an ST has it's in ROM and can
happily work with just a floppy disk!).

Support? Atari has never supported us, but we're still here, aren't
we? And NEW programs are coming out all the time! And older programs
are being updated now and then. And you won't need to get better,
faster, more expensive hardware to run those upgrades. And upgrades
come because there are extra features involved, not as a bugfix which
"by the way" demands more powerful hardware etc.

And we don't need a multi-billion company like microflop to keep us
alive either. As most of us have noticed, most of the Atari
programmers/developers seem to have an idealistic approach to the

whole thing. They do it because they like the machine (which actually is an excellent piece of hardware!), and maybe the community that hangs out here as well? ;-)

I'm not exaggerating a bit when I'm saying that there are some excellent software packages out there for the ST, and they don't cost a fortune either! A lot of the shareware packages outrival commercial ones and cost a lot less!

As for support for PCs- does it help if you have to be in touch with the support department of your computer- or software manufacturer every week, when you could get your work done with an ST a long time ago? If you're really worried about support- look to this group for it! I know I do. I haven't been disappointed yet.

And if you've been a while on the net you can probably notice the friendly and helpful atmosphere in the Atari groups. People are generally very helpful here, and everybody, from the beginner to the expert is welcome here.

How/where to buy one?
As I don't live in the US I can't really recommend anything to you, though I'm sure others here can. But for a used machine you could place an ad here. Good luck!

Hallvard
(a happy STe owner)

Yup they are graphics files. The only PC viewer I saw had to use .SPU
files. .SPC files are compressed and cannot be used. .SPX are multi
screen pics of the scroll up and down variety (usually of Page 3's).

If you have an Atari ST then you can use GemView (Shareware) to
convert the SPCs and possibly some of the others. Otherwise you'll
have to try and find a convertor on the PC, and you are unlikely to
find one !

Nb. where the pics on 'Opposition' compilation disks ???

Theoretically if you use HS-Modem to speed up the port, using any
comms prog, set at 19200bps will run as fast as it can (in this case
38,400bps)

The above is AFAIK

j>

j> Is this the case or am I doing something
wrong?

Don't worry. The h/w mod you have done forces the DTE speed to 38400 when it is switched in. The actual speed across the i/f will be determined by RTS/CTS so software will need to push data fast enough so as not to degrade the possible hardware rate. You will need to be running HSMODEM to service the serial port at a sufficient
rate.

If you have the right modem options set you should find a DTE rate of 38400 reported when you make a connection. The DCE rate reported will depend on the modem speed, the lines you are using and the speed of the modem you connect to. The speed of the whole connection will be determined by the slowest part of the data
path.

>course) is that I just happen to have the ICD-Link laying around.
>

If you do not want to upgrade to a Link II then I don't really think
the IOmega Zip is what you want to be looking at, especially if it is
to be the only device you have connected as you will run into both
parity and power problems... the Syquest EZDrive however will work quite
happily with a regular Link (One).

I suppose it depends on the price of those where you are though and
how much of a deal you could get on the IOmega... And don't take my word
as Gods honest' as I HAVEN'T actually tried the Link/Iomega combo myself,
just what I have heard from ICD and others when I was thinking of the same
solution to my storage problems, in the end I just got the Link II though.

Later...

My poor baby is sick. When I turn everything on, the monitor stays a bright white. I'm not sure if it's the computer itself or the cord or the monitor that is bad.

Other pertinent info:
- when I press a key...it 'clicks' normally
- when i move the mouse around to where the drive icons are and click, the disk drive is accessed normally

So the computer is obviuosly not completely dead...but that output port might be. Is this a common problem? Is there likely a quick-fix for it???

advTHANKSance,

It would be possible to extract to memomory, but then again you can do
the same thing by simply installing a ram disk.

You need to solder about 12 points on the motherboard.

> I am primarily interested in whether the process is
> easily reversible and/or removable.

It is possible to remove the modifaction again, but it's a bit tricky - Anyway why do you wan't to remove it again ?? aaaaahh maybe because of a AfterBurner68040 card ?? :-)

> Does installation require cutting
> circuit traces?

Yes, if you wan't the FPU to go at 40 Mhz and the DSP at 50 Mhz, you need to cut two lines. BUT if you don't want these features, you can just leave it unmodified.

But to a large extent - the PC community *does* throw it all away and start again every 2 or 3 years. PCs will still be around in 5 years time. They will look like PCs, run PC software and maybe even take some of the existing PC expansion cards.

Internally though they will have sub-systems unheard of in current PC technology. They may have multiple RISC chips emulating Intel designs; they may just be like the DEC Alpha PC or a PowerMac.

The main point is that it just won't matter. They'll be as much PCs - as the current generation are.

Of course there is nothing to stop the Atari market going down the same path. Honestly though I believe it future is in 'pigybacking' on the back of current PC and Mac developments. No small Atari centred firm can last for ever building processor accelerators for the current range of Ataris. Building whole new motherboards from scratch is quite an expensive operation too.

> Luckily, we, as hobbyists, can take the more rational decision to use
> machines which have a sensible architecture which makes efficient
> software possible.

This I can agree with though. I'm using my TT now as I like it - and I like the software I'm using on it. My PC probably will get turned on today - but only because it does some things better - and I might as well use the best tool I have for the job in question.

:-)

I have been using Stephan Lindner's TeX successfully for qite some time. As I have now got 4Mb RAM I thought it would be a good idea to install his 1993 version of Big-TeX
v2.54.

Problems... this version does not seem to understand the 'german', 'beginkeytable' and 'endkeytable' directives in the TEXSETUP file which the smaller version
required.

As a result I
get:

No German characters set when compiling German .TEX
files.

EOF not converted to \endinput when processing LaTeX
files.

Does anyone know how I can avoid these errors? I could edit all files and put \endinput at the end, I suppose, but I guess Stephan did not intend us to have to do
that.

```
*--------------------------------------------------------------------------*

From atari-announce@lexicor.com (BlowUP)
Newsgroups: comp.sys.atari.announce
Subject: BLOWUP - FX (falcon extender)
Organization: Lexicor Software Corporation
Date: Wed Sep 27 18:07:23 MET 1995

Finally BlowUP-The Falcon Company has finished it's ultimate extension-card
for
the ATARI Falcon030:

FFFFF X X
F X X
FFF XX
F X X
F X X the Falcon Xtender

And these are the Features:

FastRAM-Expansion (max. 32MB)
-----------------------------
** 4 SIMMxSlots onboard (fits into original case)
** 4 additional slots on optional daugther-card
** 1MB and 4MB SIMMs, two-by-two
** The original 4MB of the Falcon stay active.
** With only 2*4MB and 2*1MB inserted, your Falcon then has 14MB!
** Memory over 14MB is organized virtually.
** With speeder: data throughput up to 20MB/s (standard 8MB/s).
** No soldering for RAM-function neede!
** Expansion-port daisychained! Tested with NOVA & FalconSpeed!

Hi-Speeder: CPU, DSP & Systemclock:
-----------------------------------
** Systemclock 32, 36 or 40MHz
** CPU/FPU-Clock 16,18,20,32,36 or 40MHz
** DSP 50 instead of 32 MHz
** Switchable by software.
** Soldiering needed.

Resolution-Expansion BlowUP Hard I
----------------------------------
The original with the Video-Mode-Generator
with improved bustiming higher resolutions/refreshrates in 256
colors/TrueColor.
```

Installation:

If only the RAM-option is to be used, no soldering is needed for
installation.
The card is simply plugged into the expansion-slot, which is daisychained, so
that other expansions might be used in rebuilt (tower-)Falcons. Only a small
piece of the
shielding has to be removed in normal Falcons. For the speeder-option
soldiering is needed as with other speeders available, so that rebuilding
from

those other Speeders is easy. Soldiering should only be made by routiened
people.

Fast-RAM:

The Fast-RAM follows the Falcon RAM (4MB), the original 4MB-RAM-PCB in
Falcon will still be used! There are 4 SIMM-sockets on the FX-card giving you
two 16bit memory-banks. With an optional daugther-card two further Banks are
available (fits only in
rebuilt Falcon e.g. tower). The memory-banks may be filled with 1MB or 4MB
SIMMs. This is an easy way to get 14MB with only 2 x 4MB and 2 x 1MB SIMMs.
Our FastRAM can be used for all functions , including DMA-access, except
video. As there are no
video-accesses on the FX-RAM it is up to 50% faster in color modes. The
FX-RAM
normally has no problems with installed Speeders. If the Speeder on the
FX-card is used, a special Page-mode will be used for RAM-access in the
32/36/40MHz-modes. This allows
RAM-access with no waitstates and increases the memory throughput from
normally
8MB/s to max. 20MB/s. If you don't need the speeder FX is a simple "plug'n
play" memory-card.

If more than 10MB is inserted into FX the upper part is switched by the MMU
an
the FX-logic. The management of the extended memory is done fully invisible
for all applications with the PMMU of the 68030 CPU. The speed-loos with this
is minimal compared
to virtual RAM on a harddisk. This optional configuration allows a maximum use
of
32MB. So that 8MB are standard FastRAM (no video-access) and 24MB are
EMS-RAM.
For standard applications there is no difference.

CPU-Speeder:

The Speeder included on the FX-card increases the system-clock from 32 MHz
to
36 or 40MHz. The CPU then can run with 16MHz (normal), 18MHz, 20MHz, 32Mhz,
36MHz or 40MHz. With the special FX-logic now nearly all Falcon can use the
40MHz clock. The clock

may be switched on booting or later with a CPX-module. We have also solved
the
problems some programms had with the DSP if the CPU ran at 40MHz and the DSP
at 50MHz. Soldiering is needed for installation.

DSP-Speeder:

Increases the DPS speed from 32MHz to 50MHz! Superb for MPEG-Decoder. Solved
problems with CPU at 40MHz. Soldiering is needed for installation.

BlowUP Hard1:

The well known and time-tested resolutionexpansion also found a place on the
FX-card. With the confortable Software and super resolutions (e.g. 800*608 at
84Hz ni, 1024*768 at 104Hz i). Soldiering is needed for installation.

Tecnical data:
size ~160mm*65mm, simply plugged into the expansion-slot (put trough)
power taken from expansion-slot
4 SIMM-sockets onboard for 1M*9/1M*8/ 4M*9/4M*8 SIMMs (min 70ns),
with changed FIRMWARE 16M*9 can also be used
4 additional SIMM sockets on daughter-board
with 2*4MB and 2*1MB SIMMs power consumption of ~200mA.
Controllerchip reprogrammable by software
(Hardware-update by Software possible)

--
And even better!! the price: 349,-DM
Order information:

FX is now available from all ATARI dealers, our distributors in the UK,
France, Sweden and the U.S.A.

272. PGP - is it legal ???

Newsgroup: comp.sys.atari.st
Date: 1996-01-06 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <821049282_OASIS_@phil4.demon.co.uk>
Source record: 153423

This question only really applies to those _NOT_ living in the US, unless of course they happen to know the answer. This question is really one of those legal ones (anyone know a newsgroup to post these sort of questions to ??) like the copying of TOS 2.06 for use in STonX (remember that discussion ?).

I have recently read an article in various Internet Mags, and other publications about how it is illegal to use PGP in the UK, and more recently how the US government is going to begin prosecuting.

I realise that downloading the PGP files from an American BBS or FTP/WWW site is tantamount to importing the software and hence illegal. HOWEVER there are a fair number of FTP sites in the UK that offer PGP software for download. The question is, if I download this I haven't actually imported it, so am I still prosecuteable, and if the FTP site originally imported it how come they downloaded and kept the copies in the first place even though it was and is illegal ???

If it is _legal_ to download these PGP versions from UK sites, do I detect the fact that they ahev been 'tampered' with, such that the US government can if they like read the mail encoded with them. In this case isn't it pretty much pointless using a cracked and crackable coding system, after all if a government knows how to do it, they can sell to others, and maybe clever bods can work it out for themselves anyway.

Any answers to these rather odd queries to this newsgroup if you like, or to my email address, either is perfectly acceptable.

Thanks in advance for any response

I'm afraid you'll have to be a bit more specific. CAB.OVL does have faults but it is improving all the time. What sort of problems are you having with it?

I find it pretty reliable now compared with the last couple of versions - it (the whole WWW package) does take a bit of effort to set up although it is worth it.

Back in the dark old days of PC architecture, surely someone could
have said "let's put a decent 2nd processor into the PC as standard.
We'll just let people do their own thing with it".

If this has happened, I'm sure the PC would actually be a nice
machine, hardware-wise, and still have the mouldy old 80x86 for
backward compatibility.

So where can I get ahold of Thing 1.0 - is it commercial?
and what about Magic 4, is it out yet and Falc compatable? Demos of Magic 3 Falcon compatable?
Any help?
;-)
thanx!

LiNUX is muuuuch faster than Win95. But yes, it is also very harddisk hungry.
But as you said, a nice OS.

> so you judge the hardware of his pentium on basis of a terminal program?
> come on!

Of course you can't judge a computer by a terminal program, but I can pretty
much confirm that all the terminal programs I've seen on the PC sucks big time,
and I've seen a lot.

> again, being backward compatible is a STRONG point...

Yes, but the limitations of the Intel 80x86 lies in the fact that the original 8088 8-bit
is the base, and since 80x86 has to be compatible back to this old bastard,
their assembly language gets complicated and less elegant compared to the 68xxx processors.
The Intel 80x86 is also quite a heavy bag, when it comes to multitasking
compared to 68xxx, the 80x86 doesn't have a supervisor/user mode option, which makes
programming for multitasking systems based on the 80x86 less elegant too.

> :But, an Atari Falcon is a very fair comparison to a 486-66 - I have both,
> :and guess which one I'm using...
>
> I dont believe you.

In fact, APEX does 25 frames morphing with about 30 points at about the same
speed than on a 486DX2-66 with the same two pictures and number of points.

My FX-Falcon actually kicks the DX2's ass, when it comes to APEX.

And MPEG's are played at about equal speed too. I've tried two different
MPEG players on the DX2 under Windoze95 to compare with the Falcon.

Seing is believing.

Keep Cool and Flying...

I'm no x86 programmer, but I was under the impression that these CPUs
in fact provide seven levels of protection as opposed to the two on
68K. Don't ask me what it's good for, though.

And yes, you _still_ have to worry about segments when you code for
x86, although it has some advantages (according to a friend of mine,
who is quite good at x86 programming).

>In fact, APEX does 25 frames morphing with about 30 points at about the same

That is quite impressive. I will have to d/l the APEX demo one of
these days -- but I'm afraid I will want to buy the package, which I
have absolutely no use for except playing around. And it's a bit too
expensive for that.

I have my Falcon in a Lighthouse Tower, but that doesn't come with its own PSU. Installation is pretty easy, though. If you're a bit handy, you could probably mount the Falcon motherboard in a standard (large) tower. I'm not sure whether it would fit in one of those baby towers. There is even someone on the net who managed to get the board inside a TT case.

>Also, what is FX graphics card (?) for??? I've seen some Atarians on the

It's a resolution enhancer / FastRAM card / 40 MHz speeder by BlowUP. Looks like a great piece of work, accepts 30 pin SIMMs (*cheap* second hand these days!) in pairs of 2, speeds the CPU/FPU to 32, 36 or 40 MHz (40 not on all Falcons) and increases bus speed to 18 or 20 MHz, which is nice for higher resolutions. DSP is clocked at 50 MHz.

I'm holding my breath ATM, because there's a new SpeedUP which speeds the CPU at 50 MHz and gives 25 MHz bus speed, which looks absolutely amazing. I want to be sure it's compatible with the Magnum FastRAM card before I buy it, though.

Lately, some _very_ nice toys have sure been developed for us Falconists! (Heard of the Afterburner? Too expensive for simple mortals, but it's nice to know there is an upgrade path, in case one wins the lottery or something. Hope they'll make an Afterburner060 next... :-)

Hi,

What's the word on this subject? Which of the two should one get? At
first I thought KGMD (Knarf's German MiNT Distribution) was just the
Distribution Kit w/ German docs, but as Germany is probably the
country with the most active Atari/MiNT support, does it contain extra
bonuses?

Regards,

>: I've got the RSVE circuit and mine and it works fine with that.

>It seems that I need to state clearly that I have an STe. When I select
>the dte speed in Connect, the maximum it will allow is 19200. All others
>are greyed out.

>Is this the case or am I doing something wrong?

I have an STE as well. The thing is that you only get to go up to
19200 without "Hsmodem" installed. Once the program has been properly
installed you will get additional speeds on top of 19200.
Obsviously you've gotten that far, since you say other speeds are
grayed out- I suspect you have some problems with the program
(hsmodem), or you haven't installed the RSVE board perhaps?
I think my hsmodem program is working- I'll send you a copy if you
need it.

A parenthetical note here a few weeks back suggested that he was working for some corporate giant (Nov*ll?), and pleaded with him to return to his roots.

Me too! If you haven't messed with Cadd 3d v2, you have no idea how powerful the old ST really is. And if you haven't tried it on your TT, you don't know how amazingly compatible well-written software is. AFAIK, Atari hadn't even *thought* of the TT when the Cyber STuff was written. Tom Hudson just wrote to the standards, and it works!

What ever happened to TOM HUDSON the author of CYBERPAINT and
the CYBER family of graphics programs?

This i s one of the most fantastic and powerful programs
I have ever seen. I wish its ADO FX functions were incorporated
into APEX MEDIA.

CYBER is like a VIDEO TOASTER in med. ressolution. It is going to
be great the day some one develops all the functions of this program
to work in 256 or true color.

Then this program would be the ATARI VIDEO TOASTER!

Please if you have any info about TOM HUDSON let me know.
I really admire his work for the ST.

>others. (I'm having trouble with Yahoo at the moment.)

It does that with normal STiK, too? That's a relief; I thought it was my STiK emulator. Also, I don't think it's completely "saved to the cache" yet; the file is there, with all the data intact, but if you look in the CACHE.CAB file, you should find that the URL you just loaded is not listed --- which suggests that the error is occurring before or during the update of this file.

[And no, don't ask where you can get the STiK emulator yet; it doesn't work with Jim Baumgardner's Telnet app yet, and I want to fix that before I release it. Although if you can point me in the direction of the mythical STiK developer's kit, I'll be eternally grateful...]

So, what would I have to do if I got hold of Magic, installed it on my
system and decide to run Notator SL?
Or does all of this mean that I can forget about getting Magic if I
run Notator? Is it possible to switch Magic on/off somehow and return
to the usual TOS? Any solutions?

302. NEC 3D and Atari SC1435 monitors for sale

Newsgroup: comp.sys.atari.st
Date: 1996-01-06 00:00:00 UTC
From: caruso@best.com
Message-ID: <4cl89q$12r@shellx.best.com>
Source record: 153515
Cross-posted to: misc.forsale.computers.monitors,misc.forsale.computers.other.misc,comp.sys.atari.st,biz.marketplace.computers.other,ba.market.computers

Two monitors for sale:

1. NEC 3D monitor. Excellent condition. Great 3-in-1 monitor for Atari ST/STE low, medium, and high resolutions with switchbox and 5-in-1 monitor for Atari TT and Falcon. $250.

2. Atari SC1435. Excellent condition. Stereo (sound), color monitor. $250.

I'd prefer to deliver in the Bay Area (instead of shipping them nationwide).

Prices listed, or best offer. If interested, please send e-mail to caruso@best.com or ekrimen@macromedia.com.

Thanks!

Yes, one amp is much more sensible. My TT docs says 5A, but perhaps they forgot the decimal point.

BTW, I understand some machines, eg. some MegaSTs, have no fuse, just a ferrite bead.

I retract my earlier words about Hensa! Just logged in there and everything
seemed to work just fine. A week of inconvenience is a small price to pay
for a premiere atari site!
For those that are looking for Ftp sites for the atari, I'm slowly
building a list on my Webpage from an old genie listing that I have.
Be forewarned....Nothing flashy yet. I have the music to deal with first.
Html comes later.
You can access my meager list at http://www.goldengate.net/~gregor/
go to the home page select the Atari prompt at the top of the page or
from my listings of personal pages.
I can't say that it's special but there are a few links that may be of use!
If nothing else you can boost my ego by adding a couple of notches to
the counter that I installed yesterday.

There is a program which does this called JCCalendar, which although I've failed to find it on the big ftp sites can be found on Chameleon BBS near Bristol, England on +44 1454 881095. The file is called JCCAL04G.LZH and is 166142 bytes long. The BBS is often busy so set your dialer to keep trying. There's a big database of files there and a compressed index to download full of all those files you might've missed elsewhere.

Good luck

Andrew

Hi Patric, on 06 Jan 96 you wrote:

c> Organization: University of Lethbridge Public Access Internet
c>
c> Does anyone know of a program that can print out calendars?
c> I would be very happy for the info. Thanks

There's a great one written by John Charles (sorely missed) called JC
Calendar. I've just located it at Hensa:

==========
Directory : micros/atari/tos/o/o121

00contents <CONTENTS>
jccalndr.zip 238687 bytes 28 Sep 94 17:43
o121.msg 2319 bytes 28 Sep 94 17:03
==========

It includes 12 IMG files - one for each page of the calendar - so it's
possible to change them for something in your own collection if you like. I
can't remember if it lets you change the font used for the numbers (I think
not) but it's really very nice.

>use the EZDrive as a removeable Harddrive
>and swap it back and forth with my PC.

Absolutely no problem atall. With the link you get a (0.6m?) cable, ICD Driver software and the Link. You screw one end of the cable into the link and then you basically have a cable with a SCSI plug on one end which goes into the EZ port and an ASCI(DMA) plug on the other for the atari. Thats all it is, just a cable with a big (ASCI-SCSI) blug on one end.

>I want to move files (.mid) from the PC to
>my Atari for working with midi, and also
>want to do away with the tons of floppies
>for the Atari. I will have to mail order
>items, and would like to know what I need
>to get the job done the first time!

Unfortunaeately I can forsee a quite huge problem. Floppy disks between the PC and Atari can be transfered with few problems but Hard Disks unfortunately cant! A Atari disk format is very different to that of a PC AFAIK, I've not tried it but technicaly they are different but I have a feeling that it may be possible but I really do have my doubts. Having carts for the ST and PC is no problem though. It may even be possible to have both the PC and Atari connected to the EZ at the same time (but only using one computer at a time!).

>I see Toad Computers has the ICD for $90
>do I need additional software or drivers?
>and how is the software installed, I know
>this sounds dumb, but I've never installed
>any hardware requiring special drivers.

Most of this is easy as I said before. Installing is still very east. The manual is incredibly comrehensive, there is a program called Install which formats, partitions and installs it all for you, very easy. Also you should make sure

that the EZ disks can autoboot (ask Toad) as many removable drives have problems with this but i think they are OK.

>Will the EZDrive which I have to get also,
>just plug into the ICD Link, or do I need
>special cables or different connectors
>than what come with the ICD or EZDrive?
Not unless you need more length but the longer the cables the less reliable the data and at 1.5meg a second this is quite probable. Just stick with what you get it'll work OK!

>All info you can give will be sincerely
>appreciated. You can email me or post
>to the group which I read every day.
>
>Thanks in advance.
>
>Mark Feaver mfeaver@s3.sonnet.com Stockton, CA USA

Thing 1.0 hasn't been offically released yet. The only way you can legally get hold of a copy is to register or d/l a German copy.

It's well worth registering though, it's the best desktop I've used so far.

> hardware boards in sight !

Like everything - its all a matter of how you look at it.

There has been a bit of talk here over the last few days about running full screen animations at full speed on standard falcons - and unspecified PCs.

I'd just like to get a definitions laid down, and I hope people won't mind me asking for *their* defination of what 'full screen' is - and what 'full speed' is. Also nobody has really talked about colour depth.

AFAIC Full screen is a 320x200(ish) image either filling a 320x200 res screen - or being scaled on the fly to fit a larger screen. Full speed is (at least) 25fps. Colour depth should be at least 15bit (32768 colours).

As for sound - I can't comment as I haven't done any tests. Compression is also a factor open to question. It certainly seems to help when I've used it. OTOH it does nothing for the quality.

Now - I'll be honest here. My PC can't quite perform to my specification ;-) My TT doesn't get close though. ;-(

The limition on the PC is that I can't grab 320x200 at anything over 15fps - and I get bus speed problems due to the 16bit nature of my I/O cards. The SVGA card is pretty neat becuase it has hardware scaling/smoothing of AVI files - so it makes a very good job of the output. Its the other parts of the system that let it down. However it is essentailly a cheap 486 with a few semi-obsolete AV I/O cards.

The TT can't do this for more fundemental reasons. Mainly its max colour depth is only 8bit (256) even with the Matrix COCO card it has. Shear lack of CPU and bus speed are responsible for the remainder of the problems - although the SCSI1 interface is fast enough to supply the data (I reckon about 1.5Mb/s should be fast enough for this application).

I don't have access to a basic Falcon - but if it can do it - then I'd like to know how. I really don't see how a 16Mhz machine (even with a DSP chip) can shovel the amount of data it requires.

The bottom line though is that I'm not trying to bash any machine. I'm trying to be realistic though - and to determine just what can be done with the sort of hardware people have out there.

:-)

Roland.

The problem is that a standard TT030 doesn't have power enough, it lacks the DSP.
But it's possible (of course) to make it run on a TT too, but the speed may
be slower than on the Falcon with DSP.

.AVI isn't NEARLY as heavy as MPEG-files!

And it's not entirely a M$-format. Some .AVI-types are PD.

From what I understand the reason for this is that ISIS owner (Marc Ferarri?) is no longer working on it... if it was to pass over to Marc Leveson, maybe something would get done about improving the ISIS software. A new QWK reader for ISIS has just been issued by Brian Hauer of TSO, maybe that will put some life into it, or the fact that it is now able to be sent to FSNet via Gilligans Island...

Who knows what is to become of it, and indeed the Atari ST Nets as a whole?!

1 > programs work best with it for the 1040 STE (4 megs)?

1 > I would love to be able to print in color

It won't do text, but get ImageCopy for graphics. I'll bet that v4 has good drivers for any current HPDJ model. I'm using v3.52, and it has drivers for BJs, DJs, and others. IIRC, your 600C uses 300x300 color, which is the same as the 500C.

You *could* do text by using image manipulation and ImageCopy's screen dump features, but that's a pretty funky solution.

Someday I'll get around to doing some PageStream pages with color graphics; I'll let you know how it comes out on my 500C. But PageStream 2.2 is now super cheap, should run well (albeit slowly!) on your STe, and should print to your 600C in color using the 500C driver. Cross your fingers and buy it. And get ImageCopy anyway; besides being a splendid program with lots of useful features, it includes Fastprint, which speeds up PageStream printouts remarkably.

>Hallvard

What you would need to do is have a boot manager like XBoot installed
and just make a set where MagiC is not configured to run... then reboot
your system (twice) and you'll get your regular TOS x.xx back.

>I'm searching for programe (fileselector like Freedom, Selectric or UIS)
>that can handle ZIP or LZH compressed files.

I'm not aware of any fileselector (or desktop) that can do this.
(Actually, it might be possible to program No!Desk to do it - I haven't
got around to looking at that yet - but this wouldn't solve your
problem.)

A fileselector couldn't manage it anyway - since it only passes the
name of the file back to the application that called it, not the file
itself.

Ideally what we need is a *filesystem* which treats ZIP & LZH files as
folders. I'm surprised no-one has implemented this yet. Has anyone
tried?

>understand I will need an ICD Link II, but
>have no idea what this unit/cable looks like
>or how it connects to the EZDrive. I know
>it must plug into the DMA port.

A Link v1 or the newer Link II will work in conjunction
with your ST and EZDrive. It is basically a small adapter
that looks like the end of a SCSI cable, only a little larger.
It plugs into the Hard Drives SCSI port and then a cable plugs
into the back of the Link, which goes to your Ataris DMA port.

>I see Toad Computers has the ICD for $90
>do I need additional software or drivers?
>and how is the software installed, I know
>this sounds dumb, but I've never installed
>any hardware requiring special drivers.
>
>Will the EZDrive which I have to get also,
>just plug into the ICD Link, or do I need
>special cables or different connectors
>than what come with the ICD or EZDrive?

Toad now has Link II's for $99, I just got one about two weeks
ago... the Link comes with all you need to get the EZdrive working,
ie. A cable and drivers, plus formatting utilities. Keep in mind
you may be able to get a Link (I) for less than the price of the new
model, I just sold one for $45. Which will work just as well with
the Syquest EZDrive. However the Link II will work with a lot more
items (the IOmega Zip drive / newer Quantums etc.) So may be worth it
in the long run.

>PS My brother in S.Calif. just got the EZDrive and had to
> get a special $50 scsi cable to go to his qlogic scsi

> researching for both of us! Thanks.

No special adapter is required for the Atari, apart from the link of
course! <g>.

Good luck!

Not quite a fair comparison. To put it another way - if a Falcon only
program does not use the DSP - then its going to suffer as the rest of the
Falcon is underpowered.

:-)

Roland.

:
:LiNUX is muuuuch faster than Win95. But yes, it is also very harddisk hungry.
:But as you said, a nice OS.

who cares about harddisk hungry apps? my 486 has 1.5Gb harddisk space,
and it was really cheap (US$220 for 1.0Gb...).
The fact that I could run linux was the reason I bought the PC.

:
:> so you judge the hardware of his pentium on basis of a terminal program?
:> come on!
:
:Of course you can't judge a computer by a terminal program, but I can pretty
:much confirm that all the terminal programs I've seen on the PC sucks big time,

obviously you never used telix....

:and I've seen a lot.

yeah right.

:
:> again, being backward compatible is a STRONG point...
:
:Yes, but the limitations of the Intel 80x86 lies in the fact that the original 8088 8-bit
is the base, and since 80x86 has to be compatible back to this old bastard,
:their assembly language gets complicated and less elegant compared to the 68xxx
processors. The Intel 80x86 is also quite a heavy bag, when it comes to multitasking
:compared to 68xxx, the 80x86 doesn't have a supervisor/user mode option, which makes
:programming for multitasking systems based on the 80x86 less elegant too.

users dont care about elegant programming, they are only interested in
who much does the machine cost that can run the programs I need...
Then they compare different computers and buy an x86 based machine....
:
:> :But, an Atari Falcon is a very fair comparison to a 486-66 - I have both,
:> :and guess which one I'm using...
:>
:> I dont believe you.
:

:In fact, APEX does 25 frames morphing with about 30 points at about the same
:speed than on a 486DX2-66 with the same two pictures and number of points.
:
:My FX-Falcon actually kicks the DX2's ass, when it comes to APEX.
:
:And MPEG's are played at about equal speed too. I've tried two different
:MPEG players on the DX2 under Windoze95 to compare with the Falcon.
:
:Seing is believing.

you are comparing two machines by running 2 apps? strange. BTW when you
talk about PC's it is not enough to mention the cpu. Also the video
card, VLB or PCI etc, mainboard at 33Mhz, 25Mhz or 40Mhz? etc etc
are important factors...

Well, the SAGE BBS (814-833-4073) has been in the FNET for years,
but it's dwindled down to about 30 boards now. I expect I'll be moving
to AtariNet soon, but I'm not looking forward to it. For me the number
one priority in a BBS is reliability and FoReM has certainly provided
that. I'm afraid that when I get into Binkley, JetMail, etc. that there
are too many additional things to go wrong. FoReM has been so reliable
for so long that I don't even know where my backups are kept!

```
For Sale/Wanted
Mac, AtariST, (and one possible PC item) hardware
(tell your friends!)

(this is also on my homepage: http://www.panix.com/~bwu/ )

Please reply or call me at (212) 674-6480.
Buyer pays shipping - or better, pick it up
from me in person - I am in Manhattan, NY.

For sale:

Apple Imagewriter II printer - $100 - Like new, and it prints
in color! Comes with 1/3 box of white bond tractor-feed
paper, printer and power cables, CMYK color ribbon and a
black ribbon.

Apple's trusty dot-matrix, impact printer - never
discontinued, it's still sold by Apple! Accepts single sheets
and tractor fed paper. Great for printout of multi-part forms,
preparing mailing-list address stickers, color fliers, etc. This
printer is a great workhorse for the office, and gives the
added bonus of being able to print in color from programs
such as MS Word, Macwrite II, etc. This printer is also good
for kids and parents who might like a color print of their
artwork to stick up on the refrigerator. I don't recommend
the Imagewriter II for personal correspondence - for that,
you'll be better off with an inkjet printer if you can afford
one, but if this printer has what you need, you won't find
many other printers out there that fit the bill.

The latest Imagewriter II software (7.0.1) is on Apple's server,
here.

Canon IX-30 Greyscale Scanner and Document
Auto-Feeder - $300 or best reasonable offer - Comes with
SCSI cable, power cable, and scanning software for the
macintosh. Unlike many scanners, this puppy makes no
noise (there's no fan - the scanning mechanism is sealed),
and is nice and fast. It comes with stand-alone scanning
software, which works well. One caveat is that my
Omnipage OCR package for the Macintosh does not
correctly recognize this model scanner nor it's auto-feeder
correctly. Check your OCR software if you are interested in
```

using this scanner for unattended OCR. A Windows user may have more success at finding an OCR program which supports this scanner and feeder.

44MB Syquest Drive - Please make an offer.

Lots of 44MB & 88MB Syquest Carts - Please make an offer.

Microtek 300z Color Scanner - Please make an offer.

Atari 512ST Computer I found in the trash - Seriously! Comes with mouse, some cables, and a floppy disk which was still in the computer. Don't even know if it works - if it doesn't, perhaps it'd be good for parts. Please make an offer or back it goes in the trash! Pickups in person only with this item - as with all these items, I'm willing to test it with you on the spot.

Wanted:

Apple 13" RGB Monitor swivel stand - Please make an offer.

Cr*p, The chap to get in touch with is Douglas Little, since he's the
author, unfortuanately I don't know his email address, maybe other do.
However Apex -is- still being sold, along with expose, and a new
development of Apex is being done right now (I know this because I saw
DL at the B'ham AW show a month or so back, and he was there selling
Apex and Expose and mentioned the next project he's working on !).

Hope you can find him !

Then hold on for Version 3 then <G> a lot of "cyberesque" feaetures are planned ,
and much requested and wanted I agree !

There are a load of other programs for the Falcon that cover areas that the other
programs in the cyber suite (studio etc) covered . Try contact Lexicor then have
a fairly large catalogue of such software.

lasse.carlsson@lc-studio.ct.se (Lasse Carlsson) spake thusly:

LC> Subject: Screendump with SM194
LC> Do you know a way to make a screendump
LC> on SM194. Before, I used an ACC called ClichTr on my SM124,
LC> but now I want to save screendumps as IMG-files to be able to
LC> use it in my teaching in music. Kind regards, Lasse Carlsson,
LC> Sweden

I have never heard of the SM194; is it a mono 19inch for the ST? Is it perhaps the Viking Moniterm 19inch that was sold with a card for use with the Mega ST?

For versatility in screendumps, as well as many other terrific features, I recommend ImageCopy. I have used v2.5, 3.52, and expect to buy v4 soon. It will print from full or partial screen, and save to disk in almost any format known to man (or Atarian), including IMG. I can't guarantee that it will work with your setup, but it should. The Fast Club in the UK can certainly tell you.

No, I have no connection with the program, other than using it and loving it.

"The Poor Deluded Soul" - tderrick@acpu.com

Tom Hudson is one of the authors of Autodesk's 3D Studio, the market
leading brodcast quality 3d modeling and animation software for the
PC.
I think it is safe to assume that this is the same Tom Hudson since
many basic interface similiarities exist between Cad3d on the Atari
and 3D Studio.

Unfortunately I don't think he'll be coming back!

Yes. I'm sure you are right here. When Microsoft see the end of the road approaching they will encourage a new breed of PC which will have a viable modern architecture as standard but will contain an emulation (by h/w or s/w) of the current PC. With reasonable deals on "s/w trade-in" the switch to a new architecture should be pretty painless. My only concern is why they have not done this sooner as investment in s/w products conforming to the current architecture is very expensive.

>I just purchased HP DeskJet 660 Color; a fine printer, but it seems HP
>intends to turn its customers into PC users =(...
>>>>SNIP<<<<<

Unfortuanatly so. The problem is probably due to the fact that HP
sell most of their printers to PC+WINDOWS owning consumers. This
would mean that if they can control _everything_ via driver it saves
the cost of adding buttons and stuff to the printer, and so it is
done. Obviously the removal of these buttons hasn't majorly damaged
their sales as they continue to do it. This means for us Atari uses
we are a minority, and unless some clever programmer out their decides
to develop a program that can drive these printers from Atari progs
(such as Calamus, Protext, 1st Word and all the others I use) we will
be unable to use any advanced functions.

The question this leaves is: is there any programmer out there with
time to spare who fancys solving this problem, writing possibly a
universal printer driver which can print to these new printers ??? Or
just to take the time to develop printer drivers for the most common
progs ?

Be very careful of buying 2nd Hand Atari Laser printers. The drum
inside the laser as it wears out becomes crazed (the large drum with
shiney green stuff over). If this happens a new one is needed
ususally every 10,000 copies the only problem is in replacing the
drum. Here in the Uk they are about 100quid and finding a stockist
can be VERY tricky !!!

If this is an STM or STFM I'd suggest you try connecting it to a TV
set and see if it works there, or if you're lucky enough to have a
friend with an ST, try your machine with his/her monitor.

What exactly made this happen? Has the computer been jerked around or
anything, or did you just turn on the power one day and this happened
all of a sudden? Try jerking the monitor plug on the back of the
machine a bit and see if something happens.

What kind of tweaking would this be? Surely not hacking the code or
something?

I wish Notator SL would get a proper upgrade so it would become a bit
more up to the standards of software that comes out these days, but as
far as I know, Emagic has abandoned it (or so I've heard).
It's irritating that I can't use CPX modules and even the delete
function in "Selectric" due to it's memory allocation scheme. it's not
even possible to set aside memory before you start it- it just won't
load!

And the whole program should get a "facelift" in my opinion.
Notator SL is a great program apart from these things though. It's a
shame if the rumour is true, that it's abandoned, since I know a lot
of us have invested a lot of money in this package.

352. HEWLETT PACKARD & ATARI..!!!

Newsgroup: comp.sys.atari.st
Date: 1996-01-07 00:00:00 UTC
From: thietavu@news.abo.fi
Message-ID: <4cn464$ge@josie.abo.fi>
Source record: 153358

Hewlett Packard seems to have "forgotten" all its minority customers - and I don't mean the color of our skins... Just for information: their new DeskJet, and probably other printer models, are ONLY DOS/WINDOWS-compatible !!!

This is because although you can use older HP drivers to get decent results, you can't even install and set the better models (660C, 850C, etc..) up without DOS/Windows-software! You can't e.g. align the color cartridges, or tell the printer to use "A4" European paper size.

THIS IS RIDICULOUS..!!! All we need (Amiga, Acorn and Atari users), is a simple control panel program that sends the PCL commands needed to the printer. Almost anyone could program one, knowing the correct codes! Yes, even me, I think (and I'm a terrible programmer ;-)...

But it's not OUR task to program one - WE DESERVE EQUAL SERVICE FROM HEWLETT PACKARD !!! They _can_ provide us with the basic software, if they want to. And they SHOULD DO IT !

So, my fellow HP-users... When you send your registration cards, or call the customer service - DON't FORGET TO MENTION THAT WE NEED DRIVER SOFTWARE FOR OUR SHINING NEW PRINTERS !!!!!

We paid for the fun - didn't we..? Why should we let them serve the PC- and Mac users only, and let ourselves only act as the payers - without any rights..?

IT'S ACTION - NOW.

I wrote my polite, but pretty firm letter to HP today.

Tommi (a very disappointed owner of HP 660C)

> hard ware off the beast? If it is there, leave there. The fact is
> that the Falcon has a DSP so why the IF IT WAS NOT THERE?

For me - this argument goes back to which is better:

TT or Falcon

Before I bought the TT - some people tried to convince me the Falcon was
better machine. The bottom line is:

If the software makes use of the DSP - then the Falcon is certainly better.

If the software doesn't make use of the DSP - then the TT is probably a
better bet.

At the time the TT was certainly a better bet for me - as whatever compiled
C fastest was the right machine for me. Now its certainly not so clear -
and I'm tempted to pick up a Falcon for what the DSP can do.

:-)

I can do a lot more than that. The reason I turn VM off is so I can
digitise video at a faster rate. No problem here - and I rarely run out
of memory.

> Assuming of course that windose doesn't terminally object to
> no swapfile...

Nope - if you ask it not to use virtual memory - it wont. Normally Windows
starts using VM long before it has really run out of real memory. So
turning this feature off - improves performance noticably.

:-)

Sorry but an alternative File Selector can do what the hell it likes! Look at
Freedom, it copies, searches and all that stuff. It's just like another program
that is called, sure when you click a file and OK then it just passes a name but
before that it can do whatever it has been programmed to do.

>Ideally what we need is a *filesystem* which treats ZIP & LZH files as
>folders. I'm surprised no-one has implemented this yet. Has anyone
>tried?

There is a program called Pacshell which gives you a desktop environment similar
to this, although not a new File System.

Currently my ZIP has a Link plugged directly into it with a 25-50 way adaptor which was no problem to get hold of in the UK, my Zip from HiSoft also came with a little lead to pull the extra power from the Joystick port to use it as a single drive so it is fairly easy to do.

>>disable parity (surely the link would do this automatically, as this has
>The parity of the ZIP-drive *cannot* be disabled... At least not until
>someone writes a program that directly alters the firmware of the ZIP.
>ICD ???
You mean it is actually software changable? Are you sure it is not actually hard coded into the drive as I was lead to think it was?

And why to people keep telling him to get an EZ? I like my Zip becuauuse it is truly a removable rugged medium, I could drop a zip onto concrete or just put one un-protected in an evelope and the data would certainally be intact but with an EZ you probably wouldn't even have much of a disk! If you really need speed then EZs are better but if you want to be able to pop a disks in and out like a floppy disk with no running up or downtime or without worrying about damaging them then stick with a Zip.

Hi,
I've got loads of stuff that needs to be gotten rid of and a lot of it is pretty good too! If anyone is interested please just give me a mail all prices in UK pounds, P&P depends on the items wanted, anyway here's whats on offer:

Datalite 2-"On The Fly" Hard and Floppy Disk Compressor #15

Hisoft C Interpreter-Interpereted C,2 DS disks and 340 page manual worth #50, will sell for #10

Diamond Edge 1.10-Fantastic disk optimisation and repair package. Same as V2 but with older stle interface, no less functionality except for DADE. #10

Ed Hak 3.01-Disk, Memory, File editor, very easy to use and can be used as a desktop accessory, #5.

Hotwire-Top quality program launcher, very many features and very simple to set up and use, #10.

1st Word Plus 3-Full commercial version, very competent text editor, #8.

Michtron Utilities Plus-A whole suite of progams to get you St working to it's maximum, mostly disk utilities, #5.

Tabby Graphics Tablet-Use this pen ans A5 "pad" as a replacement to or with your normal ST mouse, very easy to use and highly configurable, #30.

Loads of ST games, should work on any ST's, any offers welcome, all games dirt cheap and if you want the lot they are yours for next to nothing! All are original and most come with manuals, if you want a game but can't find it here then ask me as I have loads not yet listed:

A.P.B.,
Armour Geddon,
Atomic Robokid,
Baal,
Back To The Future 2,
Backlash,
Boulderdash+Construction Kit,
Championship Water Skiing,
Dragons Lair 2,
Eliminator,
Epic,
Fire & Forget,
Fish,
Foundations Waste,
Future Basketball,

Garfield-"Big,Fat,Hairy Deal",
Ghostbusters 2,
Gremlins 2,
Hoyles Book of (Card) Games,
Indoor Sports,
Jimmy Whites Whirlwind Snooker,
Kid Gloves,
Las Vegas,
Licence To Kill,
Midwinter II-Flames of Freedom,
Mindbender,
Operation Thunderbolt,
Power Drift,
Predator,
Risk,
Road Runner,
Star Wars,
Starray & Star Goose,
Super Space Invaders,
Superman,
The Adventures-Corporation, Supremacy & Hunter.
Venus The Fly Trap,
Wanted,
Yogi's Great Escape.

If you are interested in anything then jus give me a mail, enquiries welcome.
Also absolutely gigabytes of PD is available from me if anyone is interested for
very low prices.

I have learned a lot about computers in general over the past
days. It is nice to see people love their computers whatever
they may be , and know that some users have a few different brands!
This tells me that there most be something useful in each one of these
creatures or that some people have the money to play with each kind!

Well, whatever the reason please lets talk about each model in its
more or less standart form. Why talking about taking the DSP or other hard
ware off the beast? If it is there, leave there. The fact is that
the Falcon has a DSP so why the IF IT WAS NOT THERE?

We should be happy to know that THERE IS ONE.
WE should think of adding not taking.

Well, no offence. as I said I really learn from all and
thank each one who writes about computers.
Thanks again. Raymond Lohengrin

Either you get Ataris Development kit (very expensive), or you get the
JaguarServer (with the drawback of only working with ST/TT/Falcon).

Nod. That is the point of the little project, to attempt to track down the unsupported from the supported, and help get the new BBS doors out there out to people like yourself... for instance I just found out last night that Neverest 8.0 was updated and passed to another programmer, where for the last 2 years I've been lamenting not being able to register it...

Later...

:>higher frame rates, though the difference mostly wasn't big. One MPEG flying
:>at 29 FPS on Falcon only achieved 20 FPS on 486-120. My Falcon's memory band-
:>with is a bit better than that of a standard Falcon, but the conclusion seems
:>to be clear though: Falcon performed better in a real-life situation.
:>P.S - we tried to make the situations (graphics, etc.) identical, but one
:>can never draw very deep conclusions from tests like this.

I'm sorry but you must have been using a slow PC mpeg player, probably one
converted from a standard Unix MPEG player - As author of (a) the Falcon DSP
MPEG player I think I'm in a reasonable position to comment - If you compare
'VMPEG' on the PC (which is an optimised MPEG player, as my DSP player) then
a dx4-120 is about 3 times quicker than a Falcon with DSP.
MPEG requires about 32megs per second memory bandwidth to get FULL PAL
resolution video. The Falcon has only about a 1/4 of this...
an average PC has about 30megs/s raw access to memory - more in practice
due their large secondary caches etc. I *like* my Falcon, but I'm under no
illusions to how unpowered it is compared to modern PCs and workstations.

> do this?

No, I think many Falcon-owners today, have some kind of accellerator. The FX-card has been pretty succesful in Germany, just to mention one type of accelerator.

And remember, now you can get a AfterBurner040-card for the Falcon, and C-labs new FalconMK-X has plenty of room for such cards, it also has real sound in/out ports (round phono-type).

Actually, it's pretty easy the modify the DSP to run at 50 Mhz. Basically it's just a question of cutting the old DSP-clockwire and connect a new 50 Mhz clock.

> I think so. I stand firm with my statement. 99% of *all* Ataris
> out there do not have the power to do

99% of *All* Ataris, I do not think so. Apart from the ST, the Falcon is the most common model. The TT and MSTE are very rare compared to the Falcon.

> what even a cheap 486 based PC can do.

What can you exspect from a 10 year old computer like the ST ? Take a 10 year old PC and look at that - ugh!

The TT is 5 years old, I think it performs pretty well for its age.

> However - I will admit - a 486 PC needs more support hardware than the
> Falcon. On its own - it has trouble competing with the DSP.

You can say that again :-)

> OTOH the sort

Yes, thats correct. But the Falcon IS multimedia capable.

> Don't get me wrong - the Falcon is a good bit of kit - but in its standard
> configuration it is certainly underpowered for AV work.

Not the fastest, but _not_ underpowered. Just look at BIT BOPPER, APEX MEDIA,
OVERLAY etc.etc. these are multimedia apps.

mg> For straight MIDI - Ataris are brill. Direct to disk, well you
mg> need a lot of system and that then means PCs...

That's a laugh! :)
You will never find a more cost-efficient HD-recording system than the Falcon.
If you want to go into serious HD-recording on a PC (or Mac), the equipment you need to add to you computer costs a LOT more than a complete Falcon/Cubase Audio system (and sometimes mean syncing two programs together - which never works flawlessly).
Besides, the PC-software for midi aren't as stable as the Atari software -maybe they will be some day...
You can find more powerful HD-recording systems for the Mac, but then again we are talking about LOTS OF MONEY!!!

MD> this is what made ibm compatibles the marketleader...

Is this the same 'backward compatibility' that force you to buy the right version of programs you want to use? - there is one version that works with Windows 3.11, one for Windows -95 and one for Windows NT. Compatible? Yeah right! It's worse than TOS version problems!

MD> :Additionally, machines that are running Windows access the hard disk

MD> Atari :all abandoned their earlier platforms to make way for progress
MD> and more :powerful systems. It is tragic that the least
MD> sophisticated platform has :become the dominant one.
MD>
MD> again, being backward compatible is a STRONG point...

The hardware is still backward compatible - foolish but true (old inefficient design), but the software isn't. The bad programmers for the PC platform let the programs swell beyond sanity. They don't know what optimizing is and if programs get too big - they just say that you need a faster machine with more memory and bigger harddisk. Look at Windows-95: if I remember correctly this OS takes about 40MB on the hard drive. Windows NT completely installed takes about 80-90MB! RIDICULOUS!
Most programs take at least 9-10MB on the hard drive - just think of it, this shows very bad programming. There are even games that won't run on other than a Pentium! Compatible - NOT!
I believe that the programmers have stocks in the hardware industry - the way things are going, it definitely looks like it.
I'm VERY glad that my computer is an Atari and I won't change to another platform as long as there are TOS computers around.

MD> :But, an Atari Falcon is a very fair comparison to a 486-66 - I have
MD> both, :and guess which one I'm using...

MD>
MD> I dont believe you.

What? Don't you believe what he's saying? Why would he lie? Don't you think there are people around that use their Atari machines professionally? I work with repairs and building new PC's, but this only convinces me more that I've made the right decision.

It's not a gfx-card. It's a CPU,BUS and DSP-speeder card that also features TT-RAM and BlowUP030-screenexpander.

It plugs into the internal Falcon-BUS port and other cards can be connencted on top of it.

The graphics-card you're talking about must be the NOVA-Falcon GFX-card from ComputerInsel in Germany.

Briam said"

However, most serious Atari users have either upgraded to a 68030+ machine
like the Falcon or TT or are about to. Most folks using STe's and lower
would probably not have an interest in such software, and if they did, why
there's a wealth of C-LABs, Medusas, etc. to buy from! Let's face it,
did the folks in DOS/Windoze land worry about whether AVI players would
work on a 386SX at a decent speed? We in TOS-land have managed to tweak
and massage the ST/STe using software, keeping it current. However, the
hardware just isn't up to it. Unless we move forward (and I think it is
safe to, seeing that the stock of ST-badged machines dwindles), we'll
all be worried about the fact that a multimedia program won't work
on a Mega4. Backward compatibility cannot hold us up - ST is ten years old,
and shows it. Let's move ahead with TT/Falcon.

I agree with you completely. Why holding back programmers and hardware developes
because some people just want to play medium res. games etc. I have now very a few programs
that were written for a new computer I spent $$$$ (Falcon)
Most of the programs I run were written for my ST (which I still like). while they are good
programs they do not take advantage on the color and speed of this new computer. As you say
we need to look to the future so that we can welcome in the future
more programs like Cubase, Logic Audio, Apex etc.

These programs show what the NEW Ataris (or C-Lab) can do. These programs are poweful and
do the job at a nice speed.
May be with a new name (C-Lab) and Magic-C TOS/GEM will do better I hope.
Most people think that because Atari made game machines they never
managed to make a REAL computer. They showed us that they could make it. but marketting
the product is another story.

Now after what we have seen here lets ask. Who really is making GAME STUFF?

Raymond.

Most Falcons don't have 50Mhz DSPs and 40Mhz CPUs. I suspect most Falcons either have *no* accelerator or the BlowUp2 - which really doesn't do a lot for the performance.

> And remember, now you can get a AfterBurner040-card for the Falcon,

Accepted - there are products on the market which lift the Falcon's performance by a considerble measure.

> Actually, it's pretty easy the modify the DSP to run at 50 Mhz.
> Basically it's just a question of cutting the old DSP-clockwire and
> connect a new 50 Mhz clock.

But how many people have actually done this? Also BTW what is the DSP chip actually rated at? I've nothing against a bit of overclocking - but I'd be interested to know just how much.

> 99% of *All* Ataris, I do not think so. Apart from the ST, the Falcon
> is the most common model. The TT and MSTE are very rare compared to
> the Falcon.

Presuming that only a CPU/DSP acclerated Falcon is up to the job, do these really constitute more than 1% of the total number of Atari TOS based machines sold in the last ten years?

> What can you exspect from a 10 year old computer like the ST ? Take
> a 10 year old PC and look at that - ugh!

This I agree with. The initial point I was trying to make was that it isn't worth spending much time producing proprietry AV standards for Ataris - as less than 1% would actually have enough power to use them. What we should be doing is making software which deal with MPEG and AVI. Now I believe MPEG is being fairly well catered for - but the AVI standard is hardly recognised in the Atari world. Pity really as there is a lot available in this format.

> The TT is 5 years old, I think it performs pretty well for its age.

As I'm using one ATM - I'd have to agree. :-)

:-)

A great deal of games don't work with Magic, much less Magicmac.
Mac-Format has the full version (?) of Doom on their latest Cover-CD
(geez they _pack_ those things with stuff!), go check that out.

Quite sad..... They stuff 500Meg of stuff a month onto a CD, most of
which is new/good. ST-Format barely scrapes 700K worth, much of which
is several years old, to put on their disk... And the magazine is
getting really thin now... Doesn't look good for my poor old ST... :(

They've just released a mini-version of Apex. Basically the same as the
original with all the stuff no-one really uses taken out, and the price
halved. (Things like digitizing etc.) Most of what Apex was used for,
can now be gotten for a fair bit less. Now you just have to find
somewhere that will sell you a copy, (Toad as usual I s'pose ;)

382. CAB & Telnet BUGS!

Newsgroup: comp.sys.atari.st
Date: 1996-01-07 00:00:00 UTC
From: CALLUM.LERWICK@flight.org
Message-ID: <a61_9601080105@flight.org>
Source record: 153388

First CAB:

As I have no provider (yet! ;), I'm trying to use CAB to view pages I've downloaded onto disk, (using the 100mhz PPC's connected via direct ethernet at school! Yeah!) But there is a major killer bug: When I select the menu item for changing fonts, I just get the title bar & the outline for the dialog, then the machine freezes, (but the mouse still moves) requiring a reboot. This is on a 1mb TOS 1.0 520Tfm in medium rez using the version of CAB that came in www116 that I got off Umich (in /network/stik). I've tried w/wo Warp9, w/wo AMCGDOS xor Atari GDOS 1.1, w/wo STiK loaded & enabled, w/wo CAB.OVL renamed to CAB.OVX. The 8x16 font looks really* ugly in medium rez!! As a temporary workaround, could someone please send me a cab.inf set to use the 9 point system font for everything?

Telnet:

A Unix weenie friend of mine runs a BBS based on Citadel/UX running on a fancy Pentium system running Linux. Envious of two of the three other users who connect with SLIP to ul/ld files, check the BBS, & compile their latest C program of mass destruction, all at the same time, I was very happy to see this come out. I was in for a minor dissapointment:

1) Under Warp9, when the text got to the bottom of the window, requiring it to scroll, the text would start displaying white on white. Augh!
2) w/o Warp9, it would just crash when the window started to scroll.
3) It wouldn't close connections propperly, if I logged off with "logout", it would just hang there, if I used the "Close connection" menu item, it would tell me something about "Connection close failed: receved EOF".

Wish list:

1) Multiple connections.
2) Terminal emulation.
3) Make text white on white

383. Deskjet 855C Printing

Newsgroup: comp.sys.atari.st
Date: 1996-01-07 00:00:00 UTC
From: fox@vulcan
Message-ID: <4cp33d$n33@filet.nrlssc.navy.mil>
Source record: 153389

We recently purchased an HP Deskjet 855C color printer with
the idea of using it both from a PC running windows (and soon
win95) _and_ from our Mega ST. We've been using a Canon
b&w bubble-jet for this up to now and it works fine - mostly since
the Canon has an Epson LQ emulation mode. (Pagestream had drivers
for the Canon directly, but Wordwriter and other programs didn't...)

The new HP deskjet however doesn't appear to have any emulation
modes at all. We found a pagestream driver for the 550C on
the Softlogik BBS, but we have many hundreds of documents in
Wordwriter that we would still like to use. We also use
AtariWorks, so options may be:

* Can we import Wordwriter documents into AtariWorks somehow?
I've tried importing directly, but that looks horrible. Going
through a plain ascii export/import stage works so-so but still
leaves a lot of clean-up work to do. Is there a program that
can read Wordwriter and put out something that AW can import?
(RTF maybe??)

* Is the 550C driver for Pagestream the most current? It's
a lot slower printing from the Atari than from the PC so far...

* Are there 855C drivers for GDOS?

* Is it possible to 'trick' Wordwriter into using GDOS to
print? (Something along the lines of the programs that let
you print to the Atari laser printer as though it were an
Epson or Diablo printer, without the original program knowing
what you did...)

* Finally, does this 855C printer really have an epson or other
emulation mode that the manual just isn't telling us about?

Thank you.

> if they want to. And they SHOULD DO IT !

HP have IMHO done several anoying things in the last year - including not supplying the sort of technical information they used to.

My major gripe is that they have left the front control panel off all their smaller laserjet printers. The last decent example of this type was the 4P which IMHO was a very nice printer. Last of a breed though.

However although I buy over fifty HP printers every year - you need to buy hundreds before HP will even listen to you as a business buyer - so I'm not holding out much hope that my complaining to HP dealers is really going to do anything more than make me feel a bit better.

I really don't think HP are going to supply anything other than PC and Mac software either. However I really don't see why they can't supply (on request) basic PCL codes for people (like Atari users) who need to know.

The only other option is to install the supplied software on a PC and capture the output on a printer. The Star LC10 I used to own had a hex mode which would just hex dump the input to the printer. From this it wouldn't be too hard to determine the sets of codes (they are going to look very similar to other HP PCL stuff which *is* published) - and then incorporate them into a simple driver.

Having said that - I think you have every right to be disapointed with HP. They have (IMHO) gone a bit downhill over the last year or so.

The MSTE4 fine - thats what I used to use.

> running Geneva, Neodesk

I'd lose these for a little while. Get it working under TOS and then worry
about adding these back in.

> I have tried to put the unix style setup on drive F: (bin, usr, etc...)
> Is this right?

Thats okay - provided you have actually converted F: to a Minix partition.

You need to put the MINIXFS.XFS where it will be picked up. Try:

c:\mint
or
c:\multitos

depending on where you got your MiNT kernel from.

Then when you reboot - MiNT will load it.

Then run MINIT to put a MINIX filesystem on drive F:. This will entirely
wipe the drive (F:) so you will need to back it up first.

I used (according to my notes):

MINIT -P -V F:

-P is protect against GEMDOS access
-C is create a MINIX V2 filesystem

I needed to make another MINIXFS partition a while back and I added the
parameter to allow for longer than 14 character names. You might want to
do this too - as it can help with untaring files created on Unix systems.

Then its up to you what you put on it. I've got GCC 2.33, the korn shell,
X11R5 and loads of Unix utilities. Mostly works fine - though its taken
some fiddling to get this way.

One word of advice - even if you are all setting this up on F: - its best to link (sln) it all to the universal drive U:. This way if you work off U: - all software can get at all parts of you HD without having to know about drive letters. very useful for ports of Unix software which tend to work like this anyway.

Anyway - thats the basic idea. If you want to do some tests - try MINIT on a floppy disk first.

:-)

Source record: 153392

I have had all he problems with CAB/STick most people are having.
After following the tip by Paul Womar, STik/CAB work fantastic.

The run time error I fixed by setting the cache or disk space to 10
megabites and leaving 3 megs free on that partition. It works very
well, also I use the STick/ CAB under GENEVA, so I limited CAB to 4
megs of RAM. (under the Genevas Flags)

All I did was to load the 00000001.HTM into STENO. text editor,
deleted everything in it and saved it with 0 bites. I then connected
and it worked, rebooted the computer and stiil worked. Then, I
disconnected and connected again to the Slip server and also worked.
So I guess the problem is solved. Why it works I do not know!

I would like to thank Paul for the Tip. THIS NEWS GROUP IS GREAT!

Here is his original posting:

It may well be illegal - I just don't know. However I would be interested
in knowing exactly what the US Goverment is going to prosecute UK citizens
for. We are not subject to US law - and unless there is already some treaty
in place - then what can they do?

OTOH I think it is fairly safe to say that somebody somewhere in the US
is likely to open to prosecuting. AFAIK PGP is classed as 'munitions' -
and *somebody* exported it from the USA.

All AFAIK and IMHO.

HP printers in my experience do not and have never had any emulation for
Epson type printers. This is not a new thing - but the way the've been
doing it at least since I've started using their printers (about 4 years ago).

They used to do an FX80(?) cartridge for the HP Deskjet 500 but it wasn't
very good. I'm pretty sure there was an Atari program which sort of did
the same thing - though it wasn't perfect either.

:-(

Tommy K Hwang <thwang@home.mysolution.com> writes:

> I personally have been looking for Atari and Acorn
>systems here, but no one has them (unless I have it shipped
>from U.K.).

Atari and compatible systems are currently supported primarily by the two
big mail order houses (STeve's and TOAD), and by a smattering of local dealers.
Most modern TOS/Falcon systems sold today are made by C-LAB. A number of
high performance, 040-based machines are also available.

As for Acorn, good luck searching - it's a tiny market computer made primarily
for British educations markets and is also sold as a home computer. There is
NO Acorn support anywhere in the US or Canada - Acorn only sells in the UK,
Australia, New Zealand, and Germany. Any software or hardware would have to
be imported, and I know of no North American Acorn dealers. I don't think that
such a dealer will ever come to pass in the US.

"Roland Givan" <rgivan@cix.compulink.co.uk> writes:

>And does not a Falcon of that specification fall into the 1% that *can*
>do this? I think so. I stand firm with my statement. 99% of *all* Ataris
>out there do not have the power to do what even a cheap 486 based PC can do.

However, most serious Atari users have either upgraded to a 68030+ machine
like the Falcon or TT or are about to. Most folks using STe's and lower
would probably not have an interest in such software, and if they did, why
there's a wealth of C-LABs, Medusas, etc. to buy from! Let's face it,
did the folks in DOS/Windoze land worry about whether AVI players would
work on a 386SX at a decent speed? We in TOS-land have managed to tweak
and massage the ST/STe using software, keeping it current. However, the
hardware just isn't up to it. Unless we move forward (and I think it is
safe to, seeing that the stock of ST-badged machines dwindles), we'll
all be worried about the fact that a multimedia program won't work
on a Mega4. Backward compatibility cannot hold us up - ST is ten years old,
and shows it. Let's move ahead with TT/Falcon.

] From: mdekker@fwi.uva.nl (Martijn Dekker) -( )--(1
] :LiNUX is muuuuch faster than Win95. But yes, it is also very harddisk h
] :But as you said, a nice OS.
]
] who cares about harddisk hungry apps? my 486 has 1.5Gb harddisk space,
] and it was really cheap (US$220 for 1.0Gb...).
] The fact that I could run linux was the reason I bought the PC.

When you're dealing with a program that accesses the hard-disk whenever
you move the _mouse_.... You've got to wonder!

So what if the thing was cheap!? If the stuff was coded properly, you
wouldn't have to worry about the problem in the first place, you could
fit 20 applications instead of 15 on a 1gig drive, and they'd be a damned
sight faster, because as they are, they are DOGS! When you need a
Pentium just to get a word-processor running decently, you've got to
worry! Obviously some of the ST stuff may not have quite as many frills,
much of which is superfluous (they're supposed to be word-processors, not
DTP for crissakes), but it's a LOT faster, and a LOT smaller! Graphics
don't come into it, as both GEM and Windows provide graphics "libraries"
which are called upon by the application... GEM appears to do it somewhat
quicker though (on a machine running at a tenth of the speed.....)

] :Of course you can't judge a computer by a terminal program, but I can p
] :much confirm that all the terminal programs I've seen on the PC sucks b
]
] obviously you never used telix....

Gotta give you that one. Saying ST comms programs are better than the
best PC ones is a stretch. Mind you, trying to do things like manually
enter AT commands is a foreign concept to some of these packages I've
used. It's nigh on impossible to get into terminal mode unless you're
logged on....

] users dont care about elegant programming, they are only interested in
] who much does the machine cost that can run the programs I need...
] Then they compare different computers and buy an x86 based machine....

Obviously. This is why MS products sell so well. But how many mac users
do you know that laugh at you when you try and explain things about your
PC? The 5200 I spent most of yesterday playing on did things simply,
that would take twice as long as any dos-box I've ever used. The machine
impressed me, something even the most powerful Pentium I've used (133
with ALL the extras), has failed to do, because the OS (Win-95) makes it
look like a 386, and the applications just don't work like they should.
It's Kludge. Sure, it gets the job done, but at what cost to sanity? (I

frequently spent much of the day abusing the various machines because of the programmers inefficiency and the problems with the windows software, and then wasting up to about half an hour upwards throughout the day waiting for Win-95 to reboot after it frequently locks up or does something untoward. Sure, the mac locks up occassionally, but only when we'd told it that it had 100Meg of virtual RAM, and were trying to load a 32Meg 24-bit picture into the thing, and then edit it (which did actually work in the end, and looked bloody impressive.... within minutes of using the program for the first time, we'd cut and pasted penguins onto a tropical beach, and it looked perfectly natural.... pretty funny too (especially the flying penguin....) The PC user in the house spent all day with his jaw hanging wondering how we were doing all this on a $2200 computer.

] :Seing is believing.
]
] you are comparing two machines by running 2 apps? strange. BTW when you
] talk about PC's it is not enough to mention the cpu. Also the video
] card, VLB or PCI etc, mainboard at 33Mhz, 25Mhz or 40Mhz? etc etc
] are important factors...

And this is the exact reason why we laugh.... Other computers don't have to worry about what graphics card they have etc. When PC games are being released with 3D-graphics boards because the machine can't cope with it (or can't due to crap programming anyway), it's starting to get beyond a joke.

It's not just 2-apps. Graphics is a good comparision, as, especially with Morphing etc., it uses a lot of sheer processing power to get things done, and the PC usually loses, despite running at several times the speed. Besides, you take the best similar programs for the PC and most other platforms, and so some of the more common stuff, and chances are, the PC won't shine too brightly.

Make sure the applications aren't written by Micro$oft either, as they cripple their software on non-intel platforms. (The beta version of MS-word (at least, I think it was MS-word), for the mac was 5 times faster than the full PC version, but the final release was 5 times slower.... Hmmmm.... And this wasn't even the PPC/FAT version.)

Say what you will, PC's are the standard, sad but true, but it doesn't mean they're good.... oh no... not by a long shot... Sure they do what you need, but with better programming, and a more efficient re-design of the architecture, they could certainly be a lot better.

>ognibene@eea.unice.fr

Sounds interesting. Why don't you send it to our address for a review in DBA diskmag? DBA diskmag is Europe's leading diskmag for the Atari Falcon. B.t.w. you can download DBA diskmag via our homepages:

www.cybercomm.nl/~spostma/home.html

I can make the game a downloadable from our pages ...

Never noticed that a keyboard 030 system (Falcon) costs
that much... (finally got to see Toad's site.. Thanks guys.).

Now I went through the sticker shock.... If I get
an Atari Falcon and use it strictly as a audio digitizer/
creations/output device, is the sound recordings compatible
with more common systems out there like NeXT and others?
Basically I need justification to spend $$ on
an unproven technology (based on my personal standards).
Is Falcon better than NT system with Turtle Beach Monterey sound
board? (Amiga and NeXT both have 8-bit sound. SCO do not have
sound neither does i860 and a few others I have.) Thanks..

-ME

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I posted earlier and got zero response, so maybe I'll try again.

I have a handful of ST systems from 0.5 meg to 4 meg with TOS from 1.00 to 1.04, internal and external drives 720K and 360K and a 5.25 drive as well. Some monitor masters, mouse masters, drive master. wico and epyx joysticks, a mouse ball and a wico ball. Seven monitors, color and mono.

I don't want much for any of it, so make me an offer. I'll take as little as $25 for the 0.5 meg ST without a drive, $25 for a drive $40 for a monitor, so make me some offers, eh?

Before I start, I am not a lawyer and this information is all AFAIK and IMHO. I accept no responsibility for any trouble you get into! Disclaimer over with ;)

PGP was written by a guy called Phil Zimmerman (sp?) and is a very secure encryption technique. Now as this was written in the States their law states the encrytion technolgy should be treated as a munition. It is therefore illeagal to export the software from the States. This, i belive, is why the exported versions of Netscape utilise a less secure encryption (more than the casual hacker can get past, but certainly do-able). Obviosuly the internet has no regard for customs which is why you can get versions in the uk (and the rest of the world !).

Now in this country (the UK) i belive it is ileagal to transmit encrtypted data over the telephone network. A case in point is modern digital phones which use a basic form of encryption (so Radio hams can't just listen to "squidygate") but still crackable. I don't think there has yet been a test case in this country for anyone using encryption (we are a bit more subtle than the American Government). I belive the government are trying to introduce a Clipper type encryption by consent but I wouldn't worry about it.

Practically, ask your self two questions

1) Is MI5 or whatever going to decode and trace every bit of data over the 'net just incase someone is using encryption?

2) Do you think they would have enough sense to "sabotage" versions of PGP on uk servers for them to be able to crack it?

Any lawyers wish to correct me or add to the question?

417. Atari ST in Montreal, Canada?

Newsgroup: comp.sys.atari.st
Date: 1996-01-08 00:00:00 UTC
From: chdupuis@odyssee.net
Message-ID: <chdupuis-0801962045180001@pool1_12.odyssee.net>
Source record: 153215

Can anybody tell me if there is anyone left still doing repairs/upgrades
on the ST in Montreal? I recently acquired a 520 I'd like to upgrade
memory-wise.

Any info will be appreciated.

Cheers,

Chris

hallvart@sn.no (Hallvard Tangeraas) writes:

>>Does anybody know why Notator SL will not work. Many programs
>>initially do not function very well, they just need tweeking and they
>>run fine.

SL was written way before MagiC existed, and interfaces quite extensively
with the hardware itself, rather than through the OS which MagiC replaces.

>I wish Notator SL would get a proper upgrade so it would become a bit
>more up to the standards of software that comes out these days, but as
>far as I know, Emagic has abandoned it (or so I've heard).

Notator was completely rewritten from scratch to turn into Logic, which
does indeed run under MagiC (quite nicely, in fact).

Notator SL is not being developed any more, all efforts are on Logic and
Logic Audio (mainly on the Mac and PC)

>And the whole program should get a "facelift" in my opinion.
>Notator SL is a great program apart from these things though. It's a
>shame if the rumour is true, that it's abandoned, since I know a lot
>of us have invested a lot of money in this package.

Well I for one am glad I upgraded to Logic - it's way more powerful if
slightly slower.

I've been using the demo for a program called ProTracker ST by ans Arild Runde and Karl Anders ygard. I like it and am interested in registering to get the full manual if this program is still supported. Does anyone know a current e-mail adress?
For the curious - this is a stereo sample player/sequencer that allows programming via a midi keyboard.

Hi,

Does anyone know how I can get around the password which is built into
the SDMANAGE program for the Gasteiner Hard Disk? I got the computer second
hand and was not given the password, and I cannot trace the guy who sold it to
me. :-(

Is there any other hard disc tools which I could use to format or zero a
partition which would work with the Gasteiner Hard disk?

Thanks
scotty.

Source record: 153221

>* Is the 550C driver for Pagestream the most current? It's a lot slower
>printing from the Atari than from the PC so far...

It's that slow because Pagestream prints through GEMDOS. You can use a printing acceleration software like my iPRN to speed things up. Factors range between 6 and 40, with the demo version being limited to about 8 times the original speed. Pagestream then must be set to "Print to device: PRN:", and off you go.

Look for the demo version in IPRN_046.LZH. The registered version iPRN II is available from me.

>* Finally, does this 855C printer really have an epson or other
>emulation mode that the manual just isn't telling us about?

No, it doesn't.

bye, Peter

Just go back to TOS.

> Or does all of this mean that I can forget about getting Magic if I
> run Notator?

You can use MagiC for all the other things and run Notator under TOS.

> Is it possible to switch Magic on/off somehow and return
> to the usual TOS? Any solutions?

Yes, no problem. MagiC boots with a little AUTO-folder .PRG called
MAGXBOOT.PRG, you just rename it to .PRX and BINGO TOS boots from ROM
as usual.

Or better, use XBOOT, STOOP or any other good bootmanager to do these
things - it's a lot easier.

Ohhh yes, it can.

> - and I get bus speed problems due to the 16bit nature of my I/O cards.

Yes, but more than 15fps is possible though with a 12 Mhz ISA BUS.

> The SVGA card is pretty neat becuase it has hardware scaling/smoothing of

Yes, you'll need a high-color capable graphics card.

> Shear lack
> of CPU and bus speed are responsible for the remainder of the problems -
> although the SCSI1 interface is fast enough to supply the data (I reckon
> about 1.5Mb/s should be fast enough for this application).

1.5 MB/s is barely fast enough for animation.

The VME-bus of the TT is a hell of a lot faster than the TT-SCSI port!!

It performs about 8-9 MB/s. It's not much in modern day, but it's certainly enough for playing 25 fps. in a 320x200'ish rez. with 256 colors. If the matrix-COCO's 256 color mode is byte-aligned (chunky), is should be able to perform a decent ani. speed.

The VME-bus of the TT is 16 bit and 16 Mhz, that what limits it from performing more than the above.

> I don't have access to a basic Falcon - but if it can do it - then I'd like to
> know how. I really don't see how a 16Mhz machine (even with a DSP chip)
> can shovel the amount of data it requires.

A 16 Mhz Falcon can acomplish about 21 fps in 320x240 High-Color (65536 colors) on the screen. When playing MPEG, the DSP does all the heavy unpacking and the CPU is trowing it to the screen.

My 36 Mhz Falcon (18 Mhz BUS) performs just about a few more than 25 fps
in 320x240 HighColor. Haven't calculated the exact framerate though. And the
50 Mhz DSP makes the minimum frame-rate go higher too.

For animations like FLI and MPEG and propably other too, the Falcon is mostly
faster running in 16-bit High-Color than 8-bit 256 colors. That's because the
Falcon-HighColor-mode is word-aligned (chunky), which means it's a lot faster
to throw
color values to the screen, than in 256 colors which is bit-plane aligned (slower method).

In High-Color mode, every pixel simply has a 16-bit value. Easy to write to.

And by the way, the current .AVI-player for the Atari, is running only in
the slow bit-plane aligned modes like the 256 color TT-low etc.etc. and doesn't
use the DSP when running on the Falcon.

Had it run in Falcon-HighColor, used the DSP, it would have been dramatically
faster. I'm open for a bet, if somebody does a Falcon-DSP .AVI-player.

> The bottom line though is that I'm not trying to bash any machine. I'm
> trying to be realistic though - and to determine just what can be done with
> the sort of hardware people have out there.

Yep :-)

I wouldn't argue with your assessment of Geneva vs MagiC, but are you
serious about Ease? It's bollocks. It looks pretty, is stable, but
is mussing so many important features (long filenames, aliases/groups,
environment variable support, drag to "..", etc) and has a truly attrocious
VT52 emulator.

: > :-)
: > Roland.
: > @CiX

: Nope! You see if you have an Atari machine without a DSP it is very underpowered...
: Basically a decent AVI player will require the True Color mode and DSP to make
: it usable ...

Completely wrong. First of all, AVI format means nothing. There are a lot of
AVI formats. AVI stands for 'Audio/Video Interleaved', and is a packet
format. The datas itself are not in the AVI format, there are compressed in
Microsoft Video 1 (MSVC), Cinepak (CVID), Ultimotion (ULTI), ...
Now, I'm going to speak about MSVC, which is the format implemented by
Dieter Fiebelkorn in his AVI player.
There is no need of a DSP for decompressing MSVC format. Using the DSP is in
fact slower than using just the MC68030. Sending/Receiving the datas from/to
the DSP is slower than just decompressing it on the MC68030.

The main problems are:
- Falcon bandwidth (mainly bandwidth used by the videl)
- Atari interleaved video format.

On True-Color mode, there are so many bytes to write that the 'packet pixels'
advantage is not valid. The fastest modes, for displaying movies on an Atari
are 1/2/4 bits per pixel (with dithering). Just look at my GEM FLI/FLC
player MOVIE100, the fastest modes are 1/2/4 bpp, although FLI files are 256

colors.

Decoding a MSVC AVI file is faster on a TT than on a Falcon (and will always be).

Of course, all this message is valid only on 'standard' Falcons, which the is the kind of computer I (and the majority of users) have.

From: cb092@FreeNet.Carleton.CA
Message-ID: <DKuEBF.MIx@freenet.carleton.ca>
Source record: 153317

All six unopened copies of the GEM for PCs gold pack, which I recently advertised have been sold. However, if any more Atarians want to make a PC perform like an ST for $35 bucks, I think I can come up with one more copy of the Gold pack which is opened, but otherwise original. In case ou missed my original post, the gold pack was produced by Digital Research Inc. (designers of the GEM interface for the Atari). The gold pack contains a very similar interface for the IBM which lauches DOS and OS/2 applications in the same way as one launches GEM applications on the atari. The gold pack includes this desktop interfaces software as well as 6 or seven IBM native GEM applications (DTP, Mapping, drawing, picture converters, etc.). The set includes a total of 11 3 1/2 disks. Anyone who wants this last set, let me know. Its US $35 just like the others.

Regards,

Keith M.

Victoria, Australia. 3977 >

G'day,
Wondering (hoping like mad really!) if anyone out there can
answer one, or even all (Now THAT would be impressive) of the mind
numbing questions below. And to you, my, and some Jag mad friends,
would be eternally indebted and equally astonished by your wisdom.

All information gratefully accepted and appreciated.

Q. What are the pin-outs for the Jaguar's DSP port?

Q. What are the pin connections to achieve two player game mode
i.e. null modem type play for games such as Doom.

Q. Are there any solid state electronics required to achieve this?

Q. What's the weather like in your great city/town? No, really!

BTW If ya a Jag nut and just wanna reply, it'd be great to hear
from you!

Cheers! And thanks in advance.

435. Deskjet 855C Printing

Newsgroup: comp.sys.atari.st
Date: 1996-01-08 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <9601080900824882@acpu.com>
Source record: 153322

rgivan@cix.compulink.co.uk ("Roland Givan") typed away as follows:

"G> HP printers in my experience do not and have never had any
"G> emulation for Epson type printers. This is not a new thing -
"G> They used to do an
"G> FX80(?) cartridge for the HP Deskjet 500 but it wasn't very
"G> good. I'm pretty sure there was an Atari program which sort of
"G> did the same thing - though it wasn't perfect either.

There is and it is called JetSet. Works as an accessory. The file
name is EPSJET.xxx IIRC. Whether it will do any good for the later
HP printers is pretty questionable - it was written for the original
DJ, I think. It does work pretty well on my 500C.

If I could figure out the german in this 'hp4lj.cpx' or whatever the
name is, that might help - but like most americans, I am even less
lingo- than techno-literate....

"The Poor Deluded Soul" - tderrick@acpu.com

>>I have an SM-124 atari monitor I will sell for 30.00 plus shipping.

>Don't take this personally please, but I'm fed up with all those very
>incomplete For-Sale posts. We don't all come from the US of f****** A.
>Shipping a 30.00 monitor from Memphis over to, say, Stockholm is
>a bit expensive, right ? Please, everyone, if you have something
>for sale, state the country/state you're living in.

>Secondly, there are other currencies than dollars in existence too.
>What do you want 30.00 of ? Yen ? Francs ? poststamps ? candy-bars ?

Eh... 30 Norwegian Kroner would suit me just fine for an SM 124 :-)
(that's about US$ 5.00). Adding postage, let's say US$ 6 for the lot!

<applause>!!!! Yes, I totally agree. It seems, from reading a lot of
posting that many (not all) Americans think they're the only country
in the world, and whatever's left is the swampland or desert!

Some time ago I read a posting in a newsgroup saying;
"something's wrong with my web browser- the text is in another language,
even though the menu is in English".
I just had to write back and tell him that there are actually web
servers outside the US!!!

438. Email address for Emagic?

Newsgroup: comp.sys.atari.st
Date: 1996-01-08 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <30f156a03a242497@sn.no>
Source record: 153325

Does Emagic have an email address?
I'd like to know if they really have abandoned Notator SL like I've heard rumours about, and if not- send them a list over improvements for an updated version. It would be nice if it could interact a little better other programs for one.

There is a great shareware conversion program for the Macintosh called
Graphics Converter. (This is *not* just the description, but the actual name
of the program.) It converts between *many* kinds of graphics formats,
including some from the Atari world. I do *not* know if this program exists
for the IBM PC compatibles, but take a look and see if you can find it.

>
>What kind of tweaking would this be? Surely not hacking the code or
>something?

Well I did that to Oasis but no, not really.

First thing to do: get rid of NVDI and any other piece of software
that does anything clever. Install them later after you've ascertained
if the thing will actually work or not.

The main problem occurs when the program loses control of the mouse
because it's not window driven. Anything that relies on form_do()
needs to be run single tasking.

Make sure that the current path is set correctly and that arguments
are passed correctly.

Turn Fastload off, TOS compatibility on, Smart Redraw off, and the
rest of the options off in the CPX.

Try changing the program name extender (really!).

Last resort is to mess around with the variables in MAGX.INF.

>I wish Notator SL would get a proper upgrade so it would become a bit
>more up to the standards of software that comes out these days, but as
>far as I know, Emagic has abandoned it (or so I've heard).
>It's irritating that I can't use CPX modules and even the delete
>function in "Selectric" due to it's memory allocation scheme. it's not
>even possible to set aside memory before you start it- it just won't
>load!

I've not seen Notator - what's this about its memory allocation
scheme? Try LIMITMEM.TTP on it.

I don't know what the default options are for the CPX module settings
if XCONTROL is not installed. It may be worth writing an Sconfig()
utility to ensure nothing clever happens.

>And the whole program should get a "facelift" in my opinion.
>Notator SL is a great program apart from these things though. It's a
>shame if the rumour is true, that it's abandoned, since I know a lot

>of us have invested a lot of money in this package.

How big is it - you could email me a minimal setup. I've got a feeling now for what will and won't work and I'll soon be able to tell. I wouldn't want something "usable" because:

a) I've no interest in that area (never even seen it).
b) Don't want to be accused of blatant (or any of form) of piracy.

444. MagicMac network printing

Newsgroup: comp.sys.atari.st
Date: 1996-01-08 00:00:00 UTC
From: johan.nordlander@engelska.umu.se
Message-ID: <johan.nordlander-0801962222160001@johan.eng.umu.se>
Source record: 153331

Is there any way for MagicMac to use the Ethernet port for printing to network printers? That is, I'd like to print from Calamus SL, and other programs too of course, to one of our 600 dpi network printers, one Apple and one HP. Is this possible?
I know that it should in principle be possible since you need no extras to print from SoftWindows to these printers.

I have in fact ordered a copy of NVDI for MagicMac. Well, rather a cross upgrade. Will it do the trick?

Thanks in advance

Hi friends:

Is me again. Two years ago I found the perfect case for my ST. I also got one for my Falcon. It has the same wedge shape and is also grey in color!

Well, you can find this case in the tools section of K-MART stores.

The price is $17.00 to $20.00

NOTE: just snap of the plastic inside dividers.

I hope you find this helpful. Raymond Lohengrin

There's a program (I believe it's on atari.archive.umich.edu and probably
elsewhere, too...) called 1WRD2RTF that will convert First Word (and
Word Writer) files to the more generic RTF format which Word or WordPerfect
should be able to import.

Good luck!

:]
:] who cares about harddisk hungry apps? my 486 has 1.5Gb harddisk space,
:] and it was really cheap (US$220 for 1.0Gb...).
:] The fact that I could run linux was the reason I bought the PC.
:
:When you're dealing with a program that accesses the hard-disk whenever
:you move the _mouse_.... You've got to wonder!

absolutely, but this does not happen with linux/win3.1/win95. So what is
your point?

:So what if the thing was cheap!? If the stuff was coded properly, you
:wouldn't have to worry about the problem in the first place, you could
:fit 20 applications instead of 15 on a 1gig drive, and they'd be a damned
:sight faster, because as they are, they are DOGS! When you need a
:Pentium just to get a word-processor running decently, you've got to
:worry!

yes, worry about the word processor, not the OS.

:Obviously some of the ST stuff may not have quite as many frills,
:much of which is superfluous (they're supposed to be word-processors, not
:DTP for crissakes), but it's a LOT faster, and a LOT smaller! Graphics
:don't come into it, as both GEM and Windows provide graphics "libraries"
:which are called upon by the application... GEM appears to do it somewhat
:quicker though (on a machine running at a tenth of the speed.....)
:
:] :Of course you can't judge a computer by a terminal program, but I can p
:] :much confirm that all the terminal programs I've seen on the PC sucks b
:]
:] obviously you never used telix....
:
:Gotta give you that one. Saying ST comms programs are better than the
:best PC ones is a stretch. Mind you, trying to do things like manually
:enter AT commands is a foreign concept to some of these packages I've
:used. It's nigh on impossible to get into terminal mode unless you're
:logged on....
:
:] users dont care about elegant programming, they are only interested in
:] who much does the machine cost that can run the programs I need...

:] Then they compare different computers and buy an x86 based machine....
:
:Obviously. This is why MS products sell so well. But how many mac users
:do you know that laugh at you when you try and explain things about your
:PC? The 5200 I spent most of yesterday playing on did things simply,
:that would take twice as long as any dos-box I've ever used. The machine
:_impressed_ me, something even the most powerful Pentium I've used (133
:with ALL the extras), has failed to do, because the OS (Win-95) makes it
:look like a 386, and the applications just don't work like they should.
:It's Kludge.

agreed. So win95 is not what it should have been. But the pentium133
is a very very powerful machine, in fact a friend of mine told me they
did very thorough benchmarks on it, comparing it to a high end HP
workstation, and the pentium was a very convincing winner!

:Sure, it gets the job done, but at what cost to sanity? (I
:frequently spent much of the day abusing the various machines because of
:the programmers inefficiency and the problems with the windows software,
:and then wasting up to about half an hour upwards throughout the day
:waiting for Win-95 to reboot after it frequently locks up or does
:something untoward. Sure, the mac locks up occassionally, but only when
:we'd told it that it had 100Meg of virtual RAM, and were trying to load a
:32Meg 24-bit picture into the thing, and then edit it (which did actually
:work in the end, and looked bloody impressive.... within minutes of using
:the program for the first time, we'd cut and pasted penguins onto a
:tropical beach, and it looked perfectly natural.... pretty funny too
:(especially the flying penguin....) The PC user in the house spent all
:day with his jaw hanging wondering how we were doing all this on a $2200
:computer.

so forget Windows. I did.

:] :Seing is believing.
:]
:] you are comparing two machines by running 2 apps? strange. BTW when you
:] talk about PC's it is not enough to mention the cpu. Also the video
:] card, VLB or PCI etc, mainboard at 33Mhz, 25Mhz or 40Mhz? etc etc
:] are important factors...
:
:And this is the exact reason why we laugh.... Other computers don't have
:to worry about what graphics card they have etc. When PC games are being
:released with 3D-graphics boards because the machine can't cope with it
:(or can't due to crap programming anyway), it's starting to get beyond a
:joke.

why? the performa630 my brother owns is more expensive than a 486DX2/66
and its performance is not as good. I hate system7.5, it is so slow!
And I find the lack of configurability a reason not to buy a mac.
Once you have it, you are stuck with it, no way of changing the
hardware other than buying a new one.. (I may be exaggerating, but you
get my point).

:It's not just 2-apps. Graphics is a good comparision, as, especially
:with Morphing etc., it uses a lot of sheer processing power to get things
:done, and the PC usually loses, despite running at several times the speed.
:Besides, you take the best similar programs for the PC and most other
:platforms, and so some of the more common stuff, and chances are, the PC
:won't shine too brightly.
:
:Make sure the applications aren't written by Micro$oft either, as they
:cripple their software on non-intel platforms. (The beta version of MS-word
:(at least, I think it was MS-word), for the mac was 5 times faster than the
:full PC version, but the final release was 5 times slower.... Hmmmm....
:And this wasn't even the PPC/FAT version.)

so forget MS. I did.

:Say what you will, PC's are the standard, sad but true, but it doesn't
:mean they're good.... oh no... not by a long shot... Sure they do what
:you need, but with better programming, and a more efficient re-design of
:the architecture, they could certainly be a lot better.

PC hardware is the standard, but choose your own OS. I chose Linux, and
I don't believe any atari outperforms my 486DX4/100 running linux.
but then again, one shouldn't expect this, as atari is old. I still
use my Atari ST though.

it is not the PC hardware that is crippled, it is the microsoft
software that one should avoid.

Atari drivers normally are able to read PC formatted HDs, as long as all
partitions are smaller than 32K. (You can also use SCSI-Tool an the Atari
to partition PC compatible).

>and Atari can be transfered with few problems but Hard Disks unfortunately cant!

AIUI in the UK System Solutions sell an alternative hard disk driver program called, er, Hard Disk Driver (seriously), or HDD for short. The latest version (V4.5 i think) includes a program which allows a PC-formatted hard disk to be read by an Atari.

This would enable a PC-formatted Syquest disk to be used with an Atari. Where you can get it from outside the UK i don't know, i think HDD may be a German product. Toad may do it, so that could be a place to start from.

Very clearly : Go for KGMD. This is a recent release, opposed to the MDK,
which is outdated by far (it's from 1992, if I remember right). KGMD is
also more complete (more consistent, more packages ...)

Cheers Peter

>OASIS then changing the FROM: MESSAGE ID: and REPLY TO: fields,
>altering the address to reflect what you want it to show might work,
>but I'm only guessing here !!!

The exact same thing has crossed my mind as well.
Faking an email address (which I see that many people do) shows a
pretty adolescant attitude in my opinion, and even causes a lot of
problems. A lot of people mess up the net with illegal messages and
"spams"; ads/junk-mail cross-posted to several groups, filling up the
groups with tasteless and useless messages.

Luckily there are ways to deal with these things, tracing them back to
the origin, contacting the administrator of where the person(s) have
net-access, and closing down their account. (Don't ask me how it's
done, but there are ways).

There's also a newsgroup dealing with reports like this. Something
with "net-abuse" in it I think (forgot the whole name).

: I wish Notator SL would get a proper upgrade so it would become a bit
: more up to the standards of software that comes out these days, but as
: far as I know, Emagic has abandoned it (or so I've heard).

Notator development

I have been in contact with E-Majic re these issues.

Last update of Notator SL is 3.21

Last update of Creator 3.16 (I think - I know there is an update to 3.1)

They then developed E-Majic Logic which is a complete rewrite
and much improved. However, many people still like Notator. The
criticism has been getting to grips with the increased
complexity, which most don't want and I personally know of two
Logic owners who have timing problems when a lot of tracks are
playing, running it on an STE 4meg Atari. Emajic's reply to this
is to say that reliability is not certain on these machines.
Another time also saying that `after all it is running on a very
slow 8mz computer'

re Atari development (E-Majic)

I haven't heard the latest but about two months ago they were
planning on dropping the development for the Atari computers.
They see it as a bad investment for the future.
However, rumour has it that if enough Atari Notator/Creator
owners emailed or otherwise let E-Majic know that they still
want them in the Atari market there might be a slim chance of a
re-think.

re support on E-Majic WWW page

Same story, most Atari Notator owners keep to themselves and so
there aren't a lot of messages and help tips there.#

If anyone knows of a forum where Notator owners meet and talk
etc please post it here.
I would like to compile a list of user tips and hints or brief
descriptions of how people are using their sequencing system.
If you read this please respond in this group and pass the idea
on to others

So all you Atari Musos get finger to computer key or let the
development die!

Atari Items of Interest Please

I am looking for absolutely any Atari computer information of interest for our club magazine.

Let us know what you are doing, send me the file and I will publish it, maybe you have done some Do-it-yourself type projects or are using your Atari in interesting ways. Whatever you are doing with it, please send me email about it. If you have upgraded your machine in any way then tell us about it! If there are Atari users in non English countries like Europe, Asia, South America, Africa etc, please take notice!

Any articles, tidbits, user stories, whatever else I can't think of - absolutely don't hesitate to post me your information.

Look I really like my Falcon and would never sell it, *however* it really annoys me when ignorant people like this guy start spouting on about how

much more powerful the Falcon is than a PC. They are deluded, misguided people.

For RAW power a Pentium 100mhz is about 4-10 times faster than a Falcon. With the DSP it can match a Pentium in some areas. However *even* in Digital Signal Processing algorithms that the DSP is designed specifically to do, the Pentium CPU can still match a 56001 simply because it is running at 100mhz as opposed to 32mhz. I challenge anyone to find an algorithm that can be implemented faster on a 32mhz DSP 56001/68030 than a 100mhz Pentium.

A good example of the magnitude of difference in power between the two machines is the fact that a 100mhz pentium can emulate a 68030 at faster than TT speed. Even a 68000 emulator written in C (STonX) on a fast Pentium is about 20% faster than a Falcon.

Please get a grip on reality people!

Dear Friends, there is no need to get upset here!. I don't enjoy putting down anyones computer. As we remember our writtings on Falcon Multimedia started with the idea of bringing to light that the Falcon computer is not a Toy. What should be focus on speed! Many here know what this or that computer can do. There are some people that believe the Falcon can not even play FLI/FLH. It is true that the FLI will play at the set speed they were recorded or program at, but the point our friend was making, I believe was that his small computer can play FLI animations and multitrack MOD's and I think that is pretty cool. Don't you think?

Well, it really does not matter if a Pentium can do it faster. Most people here I feel will not go for a Pentium at least for a while. We don't have to get frozzen in time with any parti cular System or computer, It is nice to know that the computer

we put money into can do real and diverse work, may be not faster than the XXX computer but at a nice pace and with grace.

Sincerely, Raymond L.

Does this mean you can see the mouse while moving it around ?

> So the computer is obviuosly not completely dead...but that output port might
> be. Is this a common problem? Is there likely a quick-fix for it???
>
Do you use an SM 124 or a color monitor ? With the SM 124 I'd ask whether
you still see the black screen border ? If not (or color) :
Do you see a difference between computer switched on or off ? Do you have
a steady picture ?
Most likely the video shifter chip is broken I'd guess.

Cheers Peter

fox@vulcan (Daniel N Fox) spake thusly:

DN> * Can we import Wordwriter documents into AtariWorks somehow?
DN> I've tried importing directly, but that looks horrible. Going
DN> through a plain ascii export/import stage works so-so but
DN> still leaves a lot of clean-up work to do. Is there a program
DN> that can read Wordwriter and put out something that AW can
DN> import? (RTF maybe??)

Whew! A lot of questions. Try Marcel, shareware, latest v I've seen is 2.3. Note also a recent message from somebody who just did a converter for FirstWord+ to RTF. WordWriter uses the same format as FW, I think - or FirstWord+(?). Anyway, it is worth a look.

DN> * Is the 550C driver for Pagestream the most current? It's a
DN> lot slower printing from the Atari than from the PC so far...

AFAIK, it is the most current. Most things print pretty slowly from the ST; PageSTream is no exception. But printer speeder-uppers for PageSTream work excellently - you'll be amazed. They include: Outburst (commercial), FPPrint (shareware - an earlier version of Outburst), and FastPrint (comes with ImageCopy from the FaST Club). My preference is for the latter - it is simple, compatible, small, and seems to speed things up as well as any. Subjective impressions only; I have not seen direct comparisons, and have not done rigorous testing. My apologies to the author of Outburst; we may come to depend on him for new PageSTream printer drivers. OTOH, maybe the FaST Club will get interested in the subject. Hint :)

My brother, a 386 pc user, has been complaining recently about the slllooowwwness of the printouts to his new LaserJet from some recent programs that he bought (3 minutes/page for his wp, 1 hour to forever for his spreadsheets). He'll probably buy a Pentium to solve the problem. Outburst or ImageCopy (for FastPrint.prg) costs quite a bit less than that!

I buy small old suitcases at yard sales for $2~$5. Line them with
packing foam, and you have a case for your ST/Falcon, mouse, pad, boxes of
disks, and cables.
Put a guitar amp strap handle on the top of an SM124, and you've got
a poor man's STacy!

|:|] Then they compare different computers and buy an x86 based machine....
|: That's precisely why they need to speed 2000bux on a machine
|: just to run the leading word processor.
|
|better than spending 2000"bux" on an atari and be completely obsolete.
Actually, you'll end up getting things done faster. Dont need
to spend 2 grand tho. And it's not completely obsolete. In fact,
for most user application needs (besides the things that are
better done on cheaper games consoles these days) an ST is
quite adequate. The public has been duped into believing they
need to run MSWord when they only need notepad or write.

A PC-GUI machine less than a 486DX/25 is a step down from an
ST despite of the tech. gap. This is primarily due to the OS.
(dos/win).

M.D.Griffiths (mdg@ukc.ac.uk) wrote:

: *Look* I really like my Falcon and would never sell it, *however* it really
: annoys me when ignorant people like this guy start spouting on about how
: much more powerful the Falcon is than a PC. They are deluded, misguided people.

: For RAW power a Pentium 100mhz is about 4-10 times faster than a Falcon. With
: the DSP it can match a Pentium in some areas. However *even* in Digital Signal
: Processing algorithms that the DSP is designed specifically to do, the Pentium
: CPU can still match a 56001 simply because it is running at 100mhz as opposed
: to 32mhz. I challenge anyone to find an algorithm that can be implemented
: faster on a 32mhz DSP 56001/68030 than a 100mhz Pentium.

First of all, for most computing tasks, RAW processor power is not
necessarily relevant. Most if not all IBM compatibles, especially those
not running 32-Bit operating systems (Windows 95 not included!) are
plagued by operating system limitations that severely cripple the
machine. This is compounded by the limited operating capacity of the bus
in clones, which for the most part, operate at standards that are almost
a decade old (PCI not included). This is slowly changing, but many cards
and their slots are still TOO slow. Mhz is irrelevant, especially when
considering all the extra work clones have to do to move memory around,
still being plagued by the 64/640k limitations, paged memory, etc... a
100mhz IBM350-100DX4 is _slightly_ faster at some things when compared to
the Falcon, but most things are _much_ slower. It is not a matter of raw
power here, because the DX4 should really be faster, but in practicality
- when it comes to trying to accomplish a task, it usually is not.

I'm not saying that the Falcon is "faster than a Pentium", but I would
imagine there are still things that the Falcon can do better. I have yet
to see any platform that can do 8, let alone 16 tracks of digital audio
without additional hardware. I personally need that. I have to assume
that the PC's innability to manage more than 4 tracks (last time I
looked) was related to the bus not being able to manage that kind of
traffic. Merely an assumption.

: A good example of the magnitude of difference in power between the two machines
: is the fact that a 100mhz pentium can emulate a 68030 at faster than TT speed.
: Even a 68000 emulator written in C (STonX) on a fast Pentium is about
: 20% faster than a Falcon.

You are comparing TT and Falcon to Pentium, and these are very different
machines. Multi-processing code on the Falcon can far exceed the TT's
abilities in some areas. When a Pentium can emulate a Falcon (or when a
Mac can for that matter) I will be quite interested.

: Please get a grip on reality people!

I would love to have a Pentium in another type of computer - but in a machine that has to rely on MS software/OS along with outdated specifications I don't think that any processor can reach it's true potential; too many bottlenecks. That architecture needs to be abandoned in favor of the furthuring of technology, and I hope it happens soon.

Aloha,

The Borg

Hello,

a friend of mine got 2 hard diks from PC. These disks are SCSI disk, Prodrive LPS 120 and 340 from Quantum.He's working with Hushi scsi tool and can read sectors, verifie these but can't partitionnig nor installing a bootsector. It seems that these disks are low-level formatted, and that he can't do nothing.

Does anybody know a solution for this problem?

Regards.

> > The limition on the PC is that I can't grab 320x200 at anything over
> > 15fps
>
> Ohhh yes, it can.

I'm sure there are cards available which *can* do more - but this is the limitation of the one I have. OTOH Expose's advertised spec is no better in this respect IMHO. Different - but not really better.

> > - and I get bus speed problems due to the 16bit nature of my I/O
> > cards.
>
> Yes, but more than 15fps is possible though with a 12 Mhz ISA BUS.

Certainly is :-) My ISA bus is currently 8.25Mhz(!) ATM AFAIK - but I might just up this to 11Mhz (33Mhz/3) and see if it all still runs. As it is - if I had AVI files with more than 15fps then it would play back faster. The best I've currently done is 160x120@21fps - but again this is because this is fastest sampling I've been able to do without dropping frames. I don't think the graphics card is running out of steam doing this.

> > The TT can't do this for more fundemental reasons. Mainly its max
> > colour depth is only 8bit (256) even with the Matrix COCO card it
> > has.
>
> Yes, you'll need a high-color capable graphics card.

I think I'm going to live with the Matrix COCO card though. I don't really *need* anything better on the TT - and a really decent VME bus graphics card costs more than a Falcon AFAIK.

> > problems - although the SCSI1 interface is fast enough to supply
> > the data (I reckon about 1.5Mb/s should be fast enough for this
> > application).
>
> 1.5 MB/s is barely fast enough for animation.

Well this is the sort of data transfer rate I require when sampling. Therefore if the HD can supply at this rate - the video should play back full speed.

> The VME-bus of the TT is a hell of a lot faster than the TT-SCSI port!!

True - but the HD is not on the VME port! ;-) (I know what you mean :-)

> It performs about 8-9 MB/s. It's not much in modern day, but it's

Its more than the ISA bus on my PC though ;-)

> certainly enough for playing 25 fps. in a 320x200'ish rez. with 256
> colors. If the matrix-COCO's 256 color mode is byte-aligned (chunky),
> is should be able to perform a decent ani. speed.

I supose so. The COCO screen ouput does seem very sluggish though. The main problem AFAICS is that the COCO is entirely unaccelerated. My PC video card is a bit sluggish too without the accelerator turned on. However with this enhancement it really does a good job of displaying the video. No jerkyness - and smoothing out of the colours so that it doesn't look pixelated from scaling the picture up. This is all down my 8.25Mhz ISA bus - so obviously the TT's higher throughput here is not enough to make up for the slow COCO video card.

> A 16 Mhz Falcon can acomplish about 21 fps in 320x240 High-Color (65536

Pretty good. It looks like I'm going to have to find a 320x240@25fps 24bit AVI file to do some more tests on. My PC is not up to generating it itself.

> And by the way, the current .AVI-player for the Atari, is running only

Anybody got any details of this? I'd quite like to try it out.

> Had it run in Falcon-HighColor, used the DSP, it would have been
> dramatically faster. I'm open for a bet, if somebody does a Falcon-DSP
> .AVI-player.

All in the drivers ;-)

I have a Mega ST4 [16mhz], I have heard about some kind of a ram upgrade that uses the Mega bus to upgrade to 8 megs of ram. Is there such a thing?

Also, is there some kind of mod still being made for the ST modem port for higher speeds above 14.4?

Could someone send or can someone sell me a copy of that magazine that shows the modem port mod?

Anyone with an old MFM drive they want to get rid of real cheap?

>Atari drivers normally are able to read PC formatted HDs, as long as all
>partitions are smaller than 32K. (You can also use SCSI-Tool an the Atari
>to partition PC compatible).

Julian!

When you say HD's do you mean Harddrives or HD floppies???
I am looking for info on EZ135, and 32k partitions would
require 421 of them for one 135meg cartridge! Is that a
typo? Can you clarify please? If I am not being too
dense (forgive me), there are only 23 drive letters left
after A,B,C (assuming C is my Ramdisk or a real HDrive).
Regarding the SCSI-Tool, will the Atari read/write the
PC formatted partition you mention? Also, where would
I obtain this software in US and what is its cost?
Thanks for responding!

A friend said:

:>the reason why I was able to let MGT player running as an ACCessory...

I can run two FLIs at full speed+ 16 channel sound on my P120.And this was with

Windows 95 and an FLI player written in C (also the APEX player is an heavily optimised 68030 Douglas Little effort - so its not a fair comparison to start with).

:>
:>
:>
:>NOTE: Please read also article on adding digital audio samples to Apex
:>or any other program (older article)

By the way:

The speed or frame rate of a FLIC FLI/FLH is not always the same. This frame rate depends on the speed or frame rate the FLI was saved at. For example, Apex Media will save the information about the frame rate or speed with the FLI as far as I know. The user can decide this rate with the speed control. This rate could be very slow or fast motion. the speed of the "X" FLIC should always be constant or same if palyed from the desktop. If the same FLIC is loaded into a FLIC player this speed can then be set to a higher rate. C s So, while FLIC playing rate might not be a very cientific way to figure out performance, I find it very interesting that the little bird can play the same animation at fast motion with audio at the same speed that the BIG BIRD played it with the speed control all the way up.

I used the FLIC player that came with ANIMATION FESTIVAL to play the FLI on the Pentium next door. I do not know which player our Falcon friend used on the IBM machine he mentioned.

Remember we are talking here about multimedia capabilities of an afordable computer. I must say here that the screen update at full screen 640x480 on the Falcon is not as fast as it should be. A little more speed would be of help (FX card!) The Pentium's screen update was very smooth I must admit.

I am not an expert in bird speed, and I am not qualified to guive speed answers. But I am happy to know that little birds can do this type of work very well!

I've recently come across a great little program called 'Robugs' written by Brad Heide back in 1992.

I'm just wondering whether Brad's still in the atari world somewhere and if anyone can put me in touch with him.

It's a kind of game/ecology thing where you design little robot bugs and let them loose in a playing field. It would be excellent for teching people about logic gates etc and of interest to A-Life fans as well.

491. Help! No sync on playback

Newsgroup: comp.sys.atari.st
Date: 1996-01-09 00:00:00 UTC
From: musicman@pixi.com
Message-ID: <4cumeg$cne@rigel.pixi.com>
Source record: 153246

Hey people....Aloha and Happy New year from Hawaii! :)

I am trying to sync to tape....using a JLCooper PPS1.

I think I am recording a sync tone/stripe on my 8 track
Tascam because I can hear the tone and I can see the master level
going into the tape, but I get no lock up on tape playback. My sequencer/
Atari computer does not recognize or hears teh sync tone I guess, because
I get no response?

I tried unplugging the return into the PPS1 but to no effect.
I think I've covered both the manuals for the Tascam 488, and the PPS1,
and of course the MSB+ (JL Cooper patchbay) thoroughly. I am probably
I think I've covered both the manuals for the Tascam 488, and the PPS1,
and of course the MSB+ (JL Cooper patchbay) thoroughly. I am probably
still missing something or one of my units are broken.

Can anyone who used these units please respond.

Awaiting any help or comments....:)

Thanks and Aloha!

vern

492. Web Icons and such

try again
Umich
/applications/dtp/fonts
If you haven't done so already, it would be a good idea to download the umich
index for future reference. It's much easier to find files if you know what
sub-directories they're hiding in!
good luck.bonne chance

495. Re: PGP - is it legal ???

Newsgroup: comp.sys.atari.st
Date: 1996-01-09 00:00:00 UTC
From: zap@eskimo.com
Message-ID: <DKxDy1.7tB@eskimo.com>
Source record: 153250

If you get the PGP files from a european bbs it is perfectly legal anywhere outside the US. The only difference between the US and European versions is the use of two different cipher libraries. Both versions are extremely secure and I have tried both. They will read messages between versions also. Go get one and enjoy!

497. STOSSER

Newsgroup: comp.sys.atari.st
Date: 1996-01-09 00:00:00 UTC
From: stosser@neon
Message-ID: <4cttsi$is@neon.airtime.co.uk>
Source record: 153252

The all new ATARI specific "STOSSER WWW PAGE" has now been
updated, HTM files now total 69, thats over 650,00bytes of ascii,
some graphics are on the pages but not enough to slow CAB down ;)
Total page size 684,000 bytes with 89 files,

All mistakes made in the first attempt have now been rectified,
more links have been added as well as FAQ, and programming
tutorials,

The page was made using Everest and CAB of which I am a
registered user, so Atarians will have no problem linking to it or
around the various pages, The page can be viewed in Atari low rez
320x200 and 16 colours, but it is advised that Meium 640x200 is
used as some pages will be more readable, but thats up to you,

I feel a WWW page is as much a part of the Atari world as any
diskzine or program, feedback is needed in order for it to
survive, there are plenty of options in the pages for you to
comment on line, or simply jot down my e-mail, so please please
do :))

Cheers......!ynoT

>
>I have tried to put the unix style setup on drive F: (bin, usr, etc...)
>Is this right?

When using a minix partition, I would recommend to make it the system
partition because once you created all the standard directories
mentioned above, you can make symbolic links to the real files
wherever trhey may be.

E.g., if your minix partition is on f: and you want to use
d:\gnu\compiler\gcc.ttp as your standard C compiler, type
ln -s d:\gnu\compiler\gcc.ttp f:/bin/cc, and each time you want to
compile anything simply type cc -o outname outname.c.

Okay - I wasn't going to confuse the issue with this - but AFAIK (to my
little understanding of AVI file formats) this is right. The one I've been
talking about is MSVC.

However - is there not a form of AVI which has uncompressed data in it?

> (ULTI), ... Now, I'm going to speak about MSVC, which is the format
> implemented by Dieter Fiebelkorn in his AVI player.

Sounds good.

> There is no need of a DSP for decompressing MSVC format. Using the
> DSP is in fact slower than using just the MC68030. Sending/Receiving
> the datas from/to the DSP is slower than just decompressing it on
> the MC68030.

Sounds even better :-)

> Decoding a MSVC AVI file is faster on a TT than on a Falcon (and will
> always be).

So what and where is the program which will do this?

> Of course, all this message is valid only on 'standard' Falcons, which
> the is the kind of computer I (and the majority of users) have.

There seems to be a bit of disagrement about this ;-) Whilst I accept that
there are many enhanced Falcons around 'here' - I bet the majority are
still fairly basic.

:-)

Roland.

I have lots of Atari St software for sale...Original disks with
documentation...lots of programs mostly games..
example Dungeon Master I and II, sundog, kings quest, time bandit,
major motion, lots of infocom games, the list goes on.
I will sell any one program for $10 (includes shipping). Must receive
cashier check/money order before will ship. If get 2 programs will
sell for $18 or 3 for $25..the more you buy the better the discount.
I can give you my phone # if anyone wants more information on the
programs available or just for verification.
Robert

Source record: 153258
Cross-posted to: misc.forsale.computers.other.software,comp.sys.atari.st

The following Atari ST Software is for Sale:

All are 3.50 disk, have original manuals, boxes, and are in very good condition. Prices are in American funds. Shipping included in price.

Lemmings ---------- $13
Megal Lo Mania * ---------- $13
Moebius ---------- $13
Spirit of Excalibur + hint book ---------- $15
Ultima IV ---------- $13
Ultima V ---------- $13

* Mega Lo Mania needs a boot disk that changes the monitor to a different MHz. I don't have this disk but I am sure one can be found on the Internet.

I`m desperately looking for driver software to my IBM 24pin
A3 proprinter... Currently I have only driver to old protext
and that doesn`t help much because I`d need to print some
greyscale pictures/text with decent fonts, so I`d need driver
for that printer to use with some Falcon program that can do
something better than just system font text... or drivers
for some ST software might also be ok, if for some good soft
I happen to have... Answers please!

There's just one thing I don't understand with this backward
compatibility thing. Intel keeps producing chips that get the same
stuff done, only at a higher temperature :-). `No, no, we can't do
anything new, people _demand_ backward compatibility'. My guess is,
they _don't_.

After all, the minute Win95 arrived, everyone en masse trashed their
old software and got Gizmo for Windows 95, Foobar for Windows 95 and
BuzzWhopper for Windows 95.

So why can't they launch a decent PPC architecture, if need be with a
Windows 96 for PPC, together with Gizmo for PPC, Foobar for PPC and
BuzzWhopper for PPC?

Don't overestimate PC users. They will buy what you tell them to,
anyway.

And _we_ would have nice cheap boxes to port MiNT to. (Will MiNT be
ported to the BeBox? Only half joking :-)

Regards,

514. Cab/Stik bombs

Newsgroup: comp.sys.atari.st
Date: 1996-01-09 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <821299888_OASIS_@ajrose.demon.co.uk>
Source record: 153269

I seem to have been going through a particularly bad patch lately of bombimg out (2 bombs) whilst loading in graphics. One site in particular seems to be completely made up of graphics, none of which give descriptions when in text-only mode (poorly coded, IMHO).

Has anyone figured out why these problems occur. In fact do many people have the same trouble. It seemed to be working fine for a very short time, but at the moment lots of sites give the same response - 2 bombs, 68000 exception (error code -69) - seriously hampering my surfing.

In the case described I seemed to be able to load some of the graphics but not others. I never got far enough in to tell the difference. Is CAB dealing properly with interlaced GIFs, or is this causing the problem?

I'll try and track down the source code for the sites I'm having trouble with. Any suggestions meantime?

Andrew

Roland

When I use the -t option with minit.prg to test the procedure I get a message:

Sorry sector size 4096 not supported

I've been told by someone else that he infact reformatted with this sector size. I think it was done with ICD utilities but I didn't do it so I'm not sure. Will I have to reformat the drive using another sector size?

Thank ye, thank ye

>for an updated version. It would be nice if it could interact a little
>better other programs for one.

YES THEY REALLY HAVE ABANDONDED IT. No more will be done to it. I know
the developers (nice guys) and all their considerable efforts are
expended on Logic nowadays.

A very slim chance... :)

>re support on E-Majic WWW page

>Same story, most Atari Notator owners keep to themselves and so
>there aren't a lot of messages and help tips there.#

Well the current EMAGIC state of the art is Logic, and that's where most
of the activity is. There is ocasional stuff about NSL on the Logic users
list (where EMAGIC frequent), but no stand alone stuff.

There are still many Notator users out there though - maybe some kind of
mailing list or something should be done...

I downloaded at set of docs entitled "CPU_ACEL", which is a series of hardware mods that you can do to speed up the Falcon (not by a whole lot, tho). One of the first things it tells me I should do is to install the "buffer mod"; while this looks extremely easy to do (just a matter of one component and a couple of wires), I am curious as to what this does? I may or may not do the other mods, but this one looks like it can be done in a matter of minutes.

: tried most of them), it suits me the best. Your comment must have been prompted
: by some problem(?). Changes.prg. What effect do you think this might be having?

Ease does not support the system sufficiently (no aliases, no long filenames,
no background disk operations, own colour icon support that uses too much
memory). But it's ok if you do not mind this. Or wait for an update.
changes.prg is a resident program that modifies system trap(s). In a
reentrant system this is a very dangerous strategy and I do not know if
this program does not have any bugs. So it is just a risk.

I think business is a bit like a democracy - you have to be ever vigilant for those things that will erode your quality of life, your beliefs, your standards and then when found, you have to fight to preserve what is right. That means voicing an opinion, request help from others who like you, believe a particular way. You have to invest a bit of yourself - and if you are a stock holder, you have an even greater opportunity to be heard - by raising a resolution - or at least the question, at the annual stock holders meeting.

Yes, I do for one. I know that I haven't used a fraction of it's power yet, therefore see it as a total waste of money to upgrade to another program.
Another thing is the learning curve which is quite steep. I still haven't gone through the whole "phone book" that came with the program. I'm more into trying out things and getting into the manual if I'm stuck.

But I still get a little irritated by the program messing up other things in my system and being very picky about auto programs and accessories. Unlike the typical Notator/Creator user as C-Lab (Now Emagic) sees/saw it I use my STe for *everything*- it's not just a "music computer". they should make the program a little more user friendly regarding the system.

By the way, that's "Emagic" and not "E-majik" ;-)

>The
>criticism has been getting to grips with the increased

Hmmm.... so does this mean that Logic really isn't suitable for a regular ST/F/M/E?
What kind of "timing problems" are you talking about, and how many tracks?

>Emajic's reply to this
>is to say that reliability is not certain on these machines.
>Another time also saying that `after all it is running on a very
>slow 8mz computer'

Stupid excuse in my opinion... but then again what do i know, as i've only got Notator SL and not Logic. I guess we are bound to meet the wall at some time, but really- seeing Notator perform is quite impressive when you can do edits etc. while the program is running.
Anyone tried it with NVDI? Does it make a *big* difference in speed? i notice that screen updates take a long time, especially while in notation.

>I haven't heard the latest but about two months ago they were
>planning on dropping the development for the Atari computers.
>They see it as a bad investment for the future.

Sad news indeed for us who have invested a great deal of money into these systems when the company seemed *VERY* serious about the Atari platform (well, they only supported one platform at the time- but the point is that they seemed serious about it, and I had a feeling they would be around for a long time, supporting their products and make it a safe investment).... I'm sort of starting to regret it now, and wondering if I should have bought Cubase instead as I understand they still support their software.

>However, rumour has it that if enough Atari Notator/Creator
>owners emailed or otherwise let E-Majic know that they still
>want them in the Atari market there might be a slim chance of a
>re-think.

Ah- that's at least a little good news... some hope.
Would you mind posting their email address then so we could do just that?
I'm definitely going to air my views to them. I've got nothing to loose.

>re support on E-Majic WWW page

>Same story, most Atari Notator owners keep to themselves and so
>there aren't a lot of messages and help tips there.#

Well, that's just because there isn't a "hangout" place for Notator/Creator users as far as I know- I'm sure a lot of us hang out in this group as well as the "synth" newsgroup (forgot the whole name of it).

Ben Hall in the UK (posted a message in this thread) has a web page with a lot of stuff regarding Logic (I think), but I don't think it has much or anything about the above-mentioned two programs.
Anyway, the URL to his web page is: http://web.city.ac.uk/~cb170
(Don't take my word for it that this page contains Logic stuff, but my memory keeps telling me so- it's been some time) ;-)

I believe there's also a mailing list which I see from my archives has the address: mtvb@rivm.nl
I guess this is to the maintainer of the list. It says "Emagic/C-lab mailing list", but I'm not sure about the details.

Regarding Logic I also found the following:

ftp://ftp.mcc.ac.uk/pub/emagic Emagic (Logic) FTP site

>I would like to compile a list of user tips and hints or brief
>descriptions of how people are using their sequencing system.
>If you read this please respond in this group and pass the idea
>on to others

That would be a great idea! Maybe you could make a "template" so that we'd know what to tell you.

>So all you Atari Musos get finger to computer key or let the
>development die!

Done... for my part anyway.
Now, let's all get something started here and "pressure" Emagic a bit if only just to say "we're still here, and we're still using your products". One thing is for sure- if we don't do anything nothing will happen and they probably will abandon the ST platform. Now we don't want that do we?

534. CAB not working for me

Newsgroup: comp.sys.atari.st
Date: 1996-01-09 00:00:00 UTC
From: ad477@freenet.unbc.edu
Message-ID: <4cvq3s$iou@freenet.unbc.edu>
Source record: 153289

I realize that many of you have already spent hours dealing with petty questions like this, but I just found out that my 'ol Atari Mega STE 4 can browse the web.

PROBLEM: I've set up both STiK and CAB the way the instructions come (I downloaded from TOAD systems). I'm using CAB 1.0a and the version of STiK that came with it. After getting it all set up, and checking the DNS settings and the IP address settings mutltiple times, I still cannot connect to web sites. I am having no problem connecting to my web server, using a SLIP connection. When I click on URL in CAB and type in the full URL (including the HTTP://) my modem sends information like crazy, but even after I recieve tidbits of data, CAB stalls at just a blank page. I am using a 2400 baud modem. Could this be the problem? I'd apprecate feedback. PS - my 'net connection works fine on a 486 with Win95, so I don't think that they're the problem.

Thanks for your help.

: The documentation that comes with PGP explains the situation in some
: detail. It's not clear whether any US legal cases will succeed, and no
: British law has been broken.

If I understand it, pgp cannot be _exported_ outside of the USA. What
I would take that to mean is that a US citizen cannot take it out
of the USA. If the license said "cannot be imported (to non-USA)"
then that would be absurd - how could the USA prosecute a UK citizen?
So while a person outside of USA might be able to get their hands on
PGP, a person in USA cannot give it to his British friend. Some
ftp sites may even deny access based upon your country of origin?

Mark,

If you are looking for PD software I can recommend Suzy B's Software.
They (I, really) are a wonderful source for all sorts of PD files. Right
now we have about 11,000 files cataloged. You may have read some of my
descriptions in my Atari Explorer Online articles, "The Unabashed
Atariophile." We also have a two vol. CD set with all of our files
on it.

The catalog comes on two disks (uncompresses to five disks), and we ask
$2 US to help cover our costs.
Our address is:

Suzy B's Software
3712 Military Road

Hello, all! I have some technical questions I'd like to ask, but I was hoping to scan a FAQ first. However, I can't seem to locate one; and the FAQ lister at Ohio State doesn't know of one for this newsgroup. (<gasp> Can it be?!) ;^) So I guess I'll have to go ahead and ask a question or two. (If anybody does know of any general FAQs for the Motorola-based Atari systems, please let me know of them as well.)

1) I know there's basically a difference between ST-RAM and TT-RAM (aka Fast-RAM), but I'd like to know what exactly that difference is.

2) If I buy a Falcon (hopefully soon!) with i MB of RAM (i = {4,14}), is that ST-RAM, TT-RAM, or some combination of the two? Comments I've seen here have hinted that it's ST-RAM and not TT-RAM.

I'll leave it at that for now, because some of my questions hinge on the answers to the above. Thanks in advance for any illumination!

Steve,

The ZIP drives are four times faster than your hard drive? I can't believe that your hard drive can be that slow! I had a ZIP drive on my PC (a parallel port version) and it was so SLOW!!! I know that the SCSI version is faster, but I didn't think it was that much faster. The EZ 135 drive from SyQuest is faster, the disks per meg are less expensive, and the drive seems to be of a higher quality construction.

Colin,

Check out Suzy B's Software. Their disks are all DS unless you ask otherwise. You could get the software you want on single-sided disks from them (from me actually, since I help run the company). We have a wide range of children's educational software, practically all that has been released PD for the ST. Our catalog listing all 11,000+ files is $2 on DS disks (two disks) or $3 on single-sided disks (four disks). You pick and choose just which files you want on your disks.

Source record: 153162

Hey... I have an MEGA STe... and I need a word processor... and perhaps a better term program...

Can anyone give me any recommendations? I really don't think ST Writer Elite holds its own any longer in this day and age... :) What's the best shareware product out now?

In the terminal program end, I've actually resorted to using FLASH 1.6 for the past few months--- it seems to work best w/ UNIX connections to the net...

Storm is nice, but it has this tendency to lock up on me(anyone else?)... the other option would be Stalker, but it's kind of slow...

connect won't allow an 80 column screen w/o having to scroll across for the last 2 or so characters, and that annoys me...

Anything else out there? Uniterm? yeah, it's okay, but the capture buffer isn't as good as the above mentioned programs.

>seems that these disks are low-level formatted, and that he can't do nothing.

Some drives need arbitration, meaning the computer has to identify itself with
its own SCSI-Id when requesting data. Since the TT is the only Atari-computer
with a proper SCSI-interface, this problem should only occur on ST-computers (I
don't know about falcon) when using disks via ACSI-port, because ACSI works
without arbtitration. But it seems strange to me that you can read sectors. On
which Computer does your friend run his drives ?

The frequency of the hi-res display of an ST is different to VGA. I think that the horizontal scan rate for hi-res is 31kHz whereas VGA is around 36kHz (I think ??). There are details of connecting a multi-sync monitor on the atari archive (umich or one of its mirrors). You may be able to find a second-hand mono-monitor for about 70 UK pounds but they tend to be fairly scarce and so hold their price well.

Hi folks!

Since half a year I'm using Internet-services with my Mega STE. UUCP and STiK are doing quite well. Allthough I would quite like to try out Linux, as I listened to many postings which made me curious.

So could anybody please tell me, what system is needed to use Linux? Does it work on a normal Mega STE (4MB)? Or will I have to change hardware stuff? Coprocessor etc.?

I'd be happy if anybody could tell me that and perhaps give me his/her e-mail-adress in case of any problems installing Linux on my machine.

Thanks!

Andreas

There is no such thing as a *right* to receive Atari-compatible software
along with your printer. As you found out, the product is clearly
labelled as DOS/Windows-compatible, not as Atari-compatible, so if
you buy such a printer, you cannot expect Atari software to be shipped
with it.

> OR even when you just think about getting a new printer - call HP
> and ask them if software is available for your favorite machine to
> control their newest printers - or whether you need to turn to Epson
> or one of their other competitors for your printing needs. That's
> more likely to get noticed if enough of us do it.

I suspect that you won't get any Atari software from Epson, neither,
so the threat is somehow weak 8-(

So what can an Atari owner do? Sending in requests for Atari software
is certainly a good idea, although I doubt that anyone could talk
the printer folks into supplying Atari software. On the other hand,
this is a perfect opportunity for Atari shareware authors! There's nothing
which keeps anyone from getting a PCL manual and writing a small
program...

558. *** UPGRADE YOUR ST/FALCON ***

Newsgroup: comp.sys.atari.st
Date: 1996-01-10 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4d0r77$e5n@huron.eel.ufl.edu>
Source record: 153175

Question: Why is everyone making a fuzz about the stock Falcon not
being this or that?

Putting cards in IBM's is some thing even OLD LADYS have to do today.

While installing that new card (even for hand scanners) may not be difficult
configuring the drivers etc. for it is usually a pain even for the experienced ones.

I know this because I havec a friend who owns an IBM repair/sales store.

So yes we have Plug and play today. I am not telling you this to argue
in pro or against the expansion deal, but just to make a point that
the reality is that:

IF YOU WANT YOUR COMPUTER TO DO MORE THAN ITS HARWARE CAN DO, THEN
EXPAND IT!

This also applies to our ST/TT/FALCON compters.

I know of some cards that are supposed to make your ST run as fast as a

TT030!

according to TOAD COMPUTERS catalog the PAK68/3 68030 can make
an ST computer run 21% faster than an stock TT030!

This cards are expensive, but they are available.

I plan to stay with my Falcon and get every nice card I can get fot
it. I like the small case because I can take it on the road, but latter
I will get another used Falcon and put it on a larger box to
welcome more cards.

Source record: 153178

I have an original disk set of Microsoft Write for
the Atari ST (Version 1.0) which for some reason has
become corrupted. Atari Customer Support could not help
me in finding out where I could get a replacement or even
an upgrade if this was available.

Does anyone know where I could get these replaced or
know of a decent Disk Doctor I could use to see what
is wrong with the original disks?

Thanks

Andrew Pearce (apearce@perth.dialix.oz.au)

TT-FastRAM access is 21 MB/s. Not bad for a 6 year old machine.

Compard to ST-RAM which is only about 7-8 MB/s on a TT.

570. Mouse Routs/Patches ????

Newsgroup: comp.sys.atari.st
Date: 1996-01-10 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <821351300_OASIS_@phil4.demon.co.uk>
Source record: 153187

Does anyone know of any mouse patches, that completely re-write GEM
and possibly provide mouse accn. as well ??? Using MACCEL 3 or
ordinary TOS/GEM routs slows the proccessor down by about 25% when the
mouse is used (check out Speedo if you don't believe me). I saw a
routine written in Assembler, include with the GFA spriteworks kit
that replaced the mouse routines and used much less processor time.
Does anyone know of a similar thing that can be stuck in the Auto
Folder ???

Thanks

Hi and greetings from British Columbia, Canada.
I've tried and failed to get stik and cab running on my Falcon. I'm using
Netscape on a PC for the Web. However in answer to your bomb-out problems
I think the documentation for stik states that it has problems with GIFs.
So it's probably not anything that you are doing. Check the docs for your
self. That is my recollection.

Are you sure about this ??? I'd guess that there are a lot of bog
standard STs and STEs around, Almost every atari I know has just a
standard ST or STE, not a Falcon or TT in sight. And thats about
40/50 ataris. You may find less ST and STE owners accesing usenet
etc. like us but that doesn't mean that people don't use there STs.

I used to call Codehead BBS all the time but alas, no more...
There might be one in Pasadena and maybe in the south bay. Pick up a
Microtimes mag. and look in the back. I think there are only two Atari
friendly shops left in the LA area. Alternative Computing is one.

Spot on. Its quite surprising that Atari didn't make the Falcon that
fast especially as it came after the TT, and its main CPU is slower
than a TTs. The DSP is capable of some pretty niffty things, but
without it the machine is good, but lacking compared esp. to a 486PC.

I'm looking to hear from anyone running a Citadel-type BBS using an Atari. (or anything else, if your not in MN!) Please Email me with the name of your BBS, the number, your alias, the type & version of software used, (if your netted) your net ID, and anything else of interest (hardware used, etc...)

I'm also interested in binaries and/or source to any Citadel variant (on any* type of 'puter) not found on the Citadel Home Page or Umich.

The Citadel Home Page can be found by searching for "Citadel BBS" on Yahoo.

: It does that with normal STiK, too? That's a relief; I thought it was
: my STiK emulator. Also, I don't think it's completely "saved to the
: cache" yet; the file is there, with all the data intact, but if you
: look in the CACHE.CAB file, you should find that the URL you just
: loaded is not listed --- which suggests that the error is occurring
: before or during the update of this file.

Either it's a bug with the STiK module (CAB.OVL) or it's a problem that
was fixed in CAB 1.16

The only other possibility that I can think of is that it's choking on
large tables, the bug fix for which is in the version _afer_ 116, but
is still undergoing final bug fixes and is not released yet.

Did they work when they were last used on the PC - and if so - what O/S were they used under?

I'v had no problem moving drives from PCs onto Ataris and back again. Whichever the drive is connected to - I can happily format and partition it.

This is using ICD Pro Utilities on a TT. Its a couple of years old now - but has useful features like being able to change the interleave. I had a drive on my PC with an interleave of 7 - and couldn't find anyway of changing it (actually only when I connected it to the TT did I find out that it was the interleave which was making it so slow). Anyway I had no problems formating and paritioning it using the ICD Pro Utilities - and after a DOS FDISK - the drive is now happily back up and running on the PC.

:-)

Roland.

Message-ID: <DKzEnr.Azw@actrix.gen.nz>
Source record: 153298

Just out of interest, would it be possible to stick a 1.44meg floppy into my external drive-case (one of those things powered from the joystick port), and actually get it to read HD disks? Apparently I need an AJAX or a GAL chip or something. I've got one of the last-model STE machines off the production line, and FWIH some of these have the right chips in them already!? How would I tell.

How complicated/expensive would it be to get this to work. If it's anything more than reasonably cheap/simple, I wouldn't bother, as it's more for interest than purpose.

BTW - About the ZIP drives, I'll phone ICD themselves later on and ask them if the ZIP will work on the Link-1. Failling that, I'll wait until one of my mates picks his up & try it on this machine. I have the latest ICD-Link software (v6.5.5), and that _may_ help.... (It comes with ZIP util's on the disk, so who knows!?)

dcohen@cix.compulink.co.uk ("Daniel Cohen") spake thusly:

"C> Marcel, which is now freeware,

Really? I must have missed the announcement. Oh well, I was happy to support the author when it was shareware. Useful program.

Is there anyone who is keeping track of these sorts of things, btw? I run into things with shareware notices in them, but it is hard to know whether the author(s) have moved, died, or have transferred the rights or released to freeware or to PD. I try to scrupulously (well, more like casually - but I think my heart is in the right place) pay shareware fees, but I hate to send checks that are not owed.

For instance, I inquired here about Robert Birmingham's address so that I could send him a check for Direct Drive, and request some help regarding a printer driver config for my DJ500C. I received no response here. I'd still like to know. Anybody?

>has much or anything about the above-mentioned two programs.
>Anyway, the URL to his web page is: http://web.city.ac.uk/~cb170
>(Don't take my word for it that this page contains Logic stuff, but my
>memory keeps telling me so- it's been some time) ;-)

It was moved a while ago, and expanded somewhat :)
The URL is http://www.mcc.ac.uk/~emagic/emagic_page.html

Yes, it is mostly Logic stuff. There is one or two bits on NSL, but not
much. If anyone wants to upload tips or anything else for the NSL section
then I'd be happy to include them on the web site.

>I believe there's also a mailing list which I see from my archives
>has the address: mtvb@rivm.nl
>I guess this is to the maintainer of the list. It says "Emagic/C-lab
>mailing list", but I'm not sure about the details.

It is mainly for Logic users, but the EMAGIC prorgammers and other staff
hang out there. To subscribe, send a mail to
majordomo@mcc.ac.uk with the body text "subscribe logic-users"
The mailing list address is then logic-users@mcc.ac.uk

>Regarding Logic I also found the following:

>ftp://ftp.mcc.ac.uk/pub/emagic Emagic (Logic) FTP site

Again, contains mainly Logic/SoundDiver related stuff. If people want to
upload Notator stuff, then I'd be happy to make a directory for them.

>>So all you Atari Musos get finger to computer key or let the
>>development die!

>Done... for my part anyway.
>Now, let's all get something started here and "pressure" Emagic a bit

>products". One thing is for sure- if we don't do anything nothing will
>happen and they probably will abandon the ST platform. Now we don't
>want that do we?

Sure, can't hurt. But don't be too expectant. It would take A LOT of
pressure to change their opinion on the Atari situation (and the NSL
situation, for that matter). Believe me, I've talked to them about it.

Jan-Olof Granlund <Jan-Olof.Granlund@sth.frontec.se> spake thusly:

J > It seems like you people are the only one left in this news
J > group. A small statistical investigation reveals that more or
J > less the same people keep asking each other questions (the
J > same questions)

Actually, when I first started lurking here, I had the same opinion.
Now, while I am pleased by the number of new people who keep turning
up, I am disappointed that the 'same people' that I was used to
seeing here don't seem to be maintaining their presence.
You are correct about the 'same questions'. We need an faq, and I
for one have been negligent about working on it.

J > It's hard to face it, but the fact is that the strange company
J > Atari seems to be going downhill rapidly. Just take a look at
J > their stocks.

Actually, their stock price has been rising lately. But who cares -
Atari Corp is almost as irrelevant to me as certain US politicians.

J > But then again, Atari people seldom wants to pay, for anything.

No argument there! But I have paid, and will pay again.

J > I put my TT030 in a corner in room. After a while I guess it
J > will go the same way as my MegaST2, into the closet.

I request that you post a For Sale here again, for both the Mega and
the TT. I have a number of people in mind that might be willing to
buy. They all live in the US, unfortunately.

I had downloaded www116 and i cannot configure dial.scr.

Here are the symptoms.
When i connect to my modem server with the ordinary vt 100 i can telnet some of the local machines and also enter the slip by starting the SLIP command.So how should i configure it ?

can someone fill it up?

SB>I have a Mega ST4 [16mhz], I have heard about some kind of a ram
SB>upgrade that uses the Mega bus to upgrade to 8 megs of ram. Is there
SB>such a thing?

Maybe, but I recommend an 68030 acceleratorcard named PAK (Prozessor Austausch Karte / processor replacement card) with FRAK (Fast Ram Karte / card). With these two things you have an 68000 running with 8Mhz (for backwards compatibility) and alternatively an 68030 running with up to 50Mhz , 4 or 16mega fastram (like the TT) and TOS 3.06.

Linux needs at least an MC68030 plus FPCP MC68881. In your case this
means a PAK68/3 + FRAK, as only 4MB ST-RAM won't bring you any fun when it
comes to using Linux seriously.

I hope MW Electronic have got their act together at last, as far as the
DIL to PLCC adapter is concerned. I got one of the first versions of the
latter and it sure gave me lots of grief. What with the continuous non-ful-
filled promises about a new adapter any time real soon now my PAK68/3 now
works fine in my daughter's 1040ST, and I got myself another TT. But at the
ProTOS last November, MW's Mr. Wirner (the 'M' part of MW) told me when I
thanked him for the treatment I received from them, the new adapters are now
available ex shelf. He in fact would have sold one to me right there and
then, had I not told him to piss off.

Actually I don't know for sure, but you might try PROGENI at 950 Decarie.
Don't have their phone No. Also try the MUSIC STORES: I think
Italmelodie was carrying Atari Falcons as late as 1993. They may still
have a technician on hand who can deal with TOS architecture. There was
an Atari user group, ASTMUM, but I don't know where to look for them.
Perhaps one of the enthusiasts from the still powerful Toronto Atari
Federation (user group) know of further leads. The TAF BBS is available
if you log on as guest, at 416 421 8999.
If all else fails, e-mail me, John S. Gray in Halifax Nova Scotia at:

Linux needs a 68030 (or better) and an FPU. Possibly fitting a PAK3 to your
MSTE might be enough - however I was in your position and I decided in
the end to sell the MSTE and buy a TT instead.

:-)

q>I have recently read an article in various Internet Mags, and other
q>publications about how it is illegal to use PGP in the UK, and more
q>recently how the US government is going to begin prosecuting.
q>
q> more snipped<

Personally I can't see UK extraditing UK subjects to US for prosecution in this matter. More because UK judges are unlikely to think that the US govt. has taken sufficient precautions to prevent non US citizens from obtaining the material. However US govt might arrest if you went to US territory, or extradite if you went to third party and compliant country.
Currently one UK arms dealer is in custody awaiting extradition to US from South Africa to face charges on which a UK court have aquitted him.
Personally I think the best solution is to raise the bandwidth. Governments which spend vast sums of money on _internal security_ ie. spying on their people, don't stay the course.
Automated posting of texts containing typical keywords eg. nuclear, bomb, semtex etc. should keep the watchers busy ;-)

I recently installed MagicMac on a PowerBook 540 with 12 Meg of RAM. I have not had time to test it intensively, but so far it is working quite well. I could not get SpeedoGDOS to work with it, but there is a special version of NVDI 3 that allows it to use Macintosh fonts, and I have that working with AtariWorks. I have also tested First Word Plus, which works perfectly. I have not had time to test much else, but I think that I can safely conclude that it will work as well on my PowerBook as on a comparable desktop Mac.

If they did - lack of backwards compatibilty would not be a problem. The
sad fact is people still want to run old sofware on their new Pentiums.

> So why can't they launch a decent PPC architecture, if need be with
> a Windows 96 for PPC, together with Gizmo for PPC, Foobar for PPC
> and BuzzWhopper for PPC?

Who is 'they' - and who is going to buy such a machine? Corporate buyers
won't so - its going to end up a minority platform - whilst the PC
bandwagon just keeps on rolling.

The PowerMac is only successful because it runs Mac software.

The Alpha PC (Windows NT on an Alpha chip) is a minority platform - because
it has no large installed software base. To benefit from the Alpha chip
- the applications have to be recompiled.

> Don't overestimate PC users. They will buy what you tell them to,
> anyway.

Maybe - but the machine *still* has to run old DOS/Windows software.

:-)

Roland.

Is the '3' above the way you start SLIP on your machine? If not
you can just add and extra set of WAIT,FIND + RESP and put in the slip
option. At my university this would be:

WAIT 30
FIND = ACS>
RESP = slip

You might want to put times in after the wait.

622. CAB/STIK problems

Newsgroup: comp.sys.atari.st
Date: 1996-01-11 00:00:00 UTC
From: daymon@sierra.valleynet.com
Message-ID: <4d1lfh$bn9@alpine.valleynet.com>
Source record: 153116

I've recently tried setting up the CAB/STIK web browser and have run into a little problem. When I try to access a URL, it connects, sends the request, but then sits at "Receive data (0 bytes)" until CAB gives up and displays a blank page. As far as I can tell, I've got the DEFAULT.CFG, DIAL.SCR, and HOSTA files set correctly according to my system and my provider. I've sent mail to the support guy listed in the documentation and haven't received a reply yet, so if anyone has any suggestions or has run into any similar problems, please fill me in. My system set up is VERY basic: 1040STf, 1 meg, no HD, TOS 1.0, and a 144 modem. I've got the cookie jar and HSMODEM06 programs set and in the auto folder, I've got the cache folder set up, everything. I don't know what else to do.

624. ICD-Link 1/ZIP - End of the story.

Newsgroup: comp.sys.atari.st
Date: 1996-01-11 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DL060p.2xs@actrix.gen.nz>
Source record: 153118
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Taking a wild guess at ICD's GEnie e-mail address, I managed to get in touch with them, and ask them what chances were of getting a ZIP drive to work with the Link-1, the results were....

You need to get the ICD Link 2 for ZIP drive support. It provides parity which the Link 1 does not. The ZIP requires parity.

You will also need to supply term power to the Link 2 since the ZIP also falls short there. Term power is 5 volts on the official SCSI term power line. It is pin 25 of the DB25 on the rear of the ZIP drive.

And then you need the ZIP utilities which are shipping with the current Link 2

I'm not too sure about the utilities, as I think most of these are basically for software ejection, and write/password protection etc. Chances are they could be required to get things going nicely though.

These devices are marvellous, I use them at work quite often, and they save huge amounts of hassle when shifting data from one machine to another & back again. (Had to back up 330Meg of data today... was still copying via Fastlynx when I left :)

So.... Anyone want to buy a perfectly good ICD-Link 1? It's still fine for those other SCSI devices! (Hard-disks etc.).

So.... Anyone want to sell me an ICD-Link 2? Offers to the address below!

You need a PMMU for any Unix (including Linux) to work. That means you
need at least an 68020 with 68851 attached, or 68030, 68040 ... as the CPU.
AFAIK this is the only requirement, however a tough one.

Cheers Peter

After 3 years of 10-15 hours/day, every weekday, I've only had Storm lock up about a dozen times and each time that I can recall, appears to have been related to unintentionally leaving the Capture Buffer on, and either Storm doesn't handle out of storage conditions or something in the buffer blows it out when I switch back to view it and it locks up.

However, for this most minimal aggravation, I like it _far_ better than _any_ other terminal program I've tried, and it is truly one of the only ones I've ever found with absolutely, rock solid, _complete_ VT100 emulation which works flawlessly on everything from 3270 emulators, to the Unix boxes of my ISP.

My only complaint is the fact that Alan Page stopped supporting it about 10 minutes after he released it (and yes, I _did_ register it!). But then I'm rather hard pressed to think of any major support it might require... other than those lock ups ;-)

Here's an answer I got from a good friend of mine concerning why HP didn't
produce a separate printer driver for each platform:

In a message of <11.01.96>, erich@hpvcpeh.vcd.hp.com (1:105/306.999) writes in
area 'MAIL':

I thought that was exactly where the problem lay: The newer PCl codes
aren't available from HP anymore. And if they are, they're probably
quite expensive. I bought the Tech Ref Guide for my HP 500, and paid
approx $75 dollar for it, including shipping. Ridiculous.

In message <4d0r77$e5n@huron.eel.ufl.edu>, afn14016@freenet.ufl.edu said:

> Putting cards in IBM's is some thing even OLD LADYS have to do today.

Exactly. However the same cannot be said for upgrading most Ataris. If you are lucky - one slot (VME etc). Many upgrades require soldering though - which is certainly not the case for the PC.

> I know this because I havec a friend who owns an IBM repair/sales
> store.

A large part of my work (and spare time) is involved in opening up machines and installing new hardware. PCs are IMHO easier to upgrade than STs and TTs ;-)

> IF YOU WANT YOUR COMPUTER TO DO MORE THAN ITS HARWARE CAN DO, THEN
> EXPAND IT!

So true.

> This also applies to our ST/TT/FALCON compters.

But its harder - especially with basic STs

> according to TOAD COMPUTERS catalog the PAK68/3 68030 can make an ST
> computer run 21% faster than an stock TT030!

Nearly bought one of these for my MSTE. However in the end decided that all the extra features of the TT were worth more to me than the possibility of slightly more speed. Actually although the PAK3 can be faster than a TT, it doesn't appear to be unless you add TT-Ram to the PAK3:

TT (ST RAM)
3571 Dhrystones

STFM, 33Mhz PAK3
3571 Dhrystones

TT (TT RAM)
5000 Dhrystones

STFM, 50Mhz PAK3
5000 Dhrystones

Its only with brute force (ie 50Mhz against 32Mhz) that an ordinary PAK3 can beat a TT with TT-RAM

For further comparison:

TT (TT RAM) Cattermaran (48Mhz 68030 - like Blowup2 for the Falcon)
6250 Dhrystones

> This cards are expensive, but they are available.

So expensive is was cheaper for me to sell the MSTE and buy a TT instead.
Having said that - the PAK3 is an excellent card - and well worth having
IMHO.

:-)

Roland.

@CiX

PS Thanks again to all the people who have supplied me Dhrystone results
in the past. :-)

632. Software FOR SALE/WANTED

Newsgroup: comp.sys.atari.st
Date: 1996-01-11 00:00:00 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <4d3al8$g03@bigboote.WPI.EDU>
Source record: 153126

The following disks/books are for sale. 1 or 2 with docs, but most of it is
oldstuff, not too hard to figure out. This package is great for people
who are trying to milk that last drop of usefulness out of your old st,
people with newer machines wont find this stuff too interesteing.
anyway, all sold as a package for the ridiculously low price of...
$40 + $5 shipping (35 disks total)

TITLE: MAKER: WHAT IS IT?:

WERCS Resource Construction Set HiSoft/Michtron Hypertext?
A-RAM Kuma/Antic RAM Disk
A-Calc Prime Kuma/Antic Spreadsheet
Kings Quest (2 disks) Sierra Game
Interlink ST Intersect Telecomm
Revolver Intersect Prog Switcher
Label Master Elite Migraph Label printer
Uniterm Antic Term Emulators
Flash 1.5 Antic Telecomm
G+ Plus CodeHead GDOS Replace
HippoArt I Hippopotamus Clip Art?
First CADD 1.0 Generic Soft CAD (easy)
Turbo ST CodeHead Accelerator
Magazine disks (21 total)
includes STFormat, STXpress, ComputeST,STAction,AccuSoftPD,
STart, and Current notes

Intermediate and Advanced Atari Subjects Book

SEPARATE FROM THE ABOVE SALE...
WHAT I AM LOOKING FOR:
I need a copy of Dr. T's KCS Level II, i own the omega package but the
LEVEL II file is corrupt, the rest of the package is fine, so i just need
level II. if someone happens to have it from the STformat cover disk,
that would be great.

Thanks a lot

rhett@wpi.edu

633. Kick OFF2 series editor wanted

Source record: 153130

Hey Vernon,

What sequencer package are you using?

What are you striping the tape with (FSK,MIDI CLOCK,SMPTE...AND at what frame rate...?)

For playback check to see that you are (1) setting the PPS1 to READ, selecting the same LEFT
switch setting (on the PPS1) that you used to stripe with (2) Either merging the MIDI out of
the PPS1 with the computer's in on your MSB+ ...OR (this is what I do) just put the PPS1 "in
line" with the MIDI input to your ST. (3) Check to be sure that your sequencer is set to sync
to MTC (IF you are using SMPTE, that is.... I don't use ANYTHING else unless working with OLD
synths). (4) MOST IMPORTANT: Set your SMPTE offset to the point in timecode (that's on your
tape) that you want your sequencer to start. ...this won't be easy to do if you don't have a
SMPTE readout in your sequencer package.

..it sounds as if you & I have some similar taste's in hardware....

... feel free to e-mail if this doesn't get it, or otherwise.......8^)

AZ> So could anybody please tell me, what system is needed to use Linux?
AZ>Does it work on a normal Mega STE (4MB)? Or will I have to change
AZ>hardware stuff? Coprocessor etc.?

You need a system with 68030 processor or better and a coprocessor. So you have to switch to the TT/Falcon or Medusa or buy a 68030 accelerator card (On the PAK it runs perfectly all right).

Tschuess Frank

639. ANN: ExtenDOS Pro 2.3 available

Newsgroup: comp.sys.atari.st
Date: 1996-01-11 00:00:00 UTC
From: Roger Burrows <rzb20@amail.amdahl.com>
Message-ID: <NEWTNews.821406603.12374.rzb20@rzb20.amdahl.com>
Source record: 153133

```
Anodyne Software announces: 11 January 1996

ExtenDOS Pro v2.3: CD-ROM with audio copy
-----------------------------------------

ExtenDOS Pro version 2.3 is the latest version of Anodyne Software's
CD-ROM drivers for Atari systems. Like previous versions, it provides
access to CD-ROMs and audio CDs on most popular CD-ROM drives, but v2.3
offers many new features including:

. direct audioCD-to-disk recording (requires compliant hardware)
. MIDI_COM support: CD-ROM drives installed by ExtenDOS Pro are now
accessible across a MIDI_COM connection
. improved automatic support for photoCD and audio CD on drives
unknown to ExtenDOS Pro
. support for single-session photoCD on the popular NEC25 drive.

It continues to offer:

. easy installation and reconfiguration via a GEM-based installation
program
. support for a wide range of CD-ROM drives, including changer
mechanisms
. an extremely stable and well-tested environment.

With ExtenDOS Pro, you can play audio CDs as easily as you can access the
data on CD-ROMs. Put a CD-ROM in your drive, and access it like a large
removable hard disk, or pop in an audio CD and use the included program
to turn your CD-ROM drive into an audio player.

Direct audioCD-to-disk recording
--------------------------------
ExtenDOS Pro now allows you to copy segments of an audio CD directly to
your hard disk, at sample rates of 25.033, 44.1, or 50.066 kHz. The
length of recording is limited only by the size of your hard disk!
Please note that this function requires the appropriate hardware support
within the CD-ROM drive; at this time, for those drives that are known
to provide some form of support, the status is as follows:

Drive Comments
----- --------
Chinon 535 (revs Q20 & R20) not tested
NEC 3X see NOTE below
Panasonic 8004 not tested
Pioneer 602x not tested
Plextor 4plex not tested
Sony 561 (& OEM equiv.) OK
```

Toshiba 3401/4101/3601 OK

NOTE: NEC 3Xp tested; it appears to function correctly, but the firmware does not always return the correct audio data, resulting in 'stuttering' in the copied file. It is not known if other NEC drives suffer from this problem.

For the latest support information, please contact Anodyne Software via GEnie (R.BURROWS1), or via the Internet (r.burrows1@genie.geis.com), or write to the address below.

Audio support

ExtenDOS Pro includes the following audio functions:

. play/pause/stop/eject
. track forward or back
. index forward or back
. skip forward or back
. cd repeat/shuffle
. scan
. set play segment
. volume control

These are provided through an interface visually similar to a standard audio CD player, with clearly-marked buttons and a complete time/track display. A smaller version of the main window may be selected at any time; this is particularly effective in reducing screen clutter when running the audio player as a desk accessory.

ExtenDOS Pro conforms to the defined CD-ROM software interface standard; programming details for this interface are available on request from Anodyne Software at the address below. The interface allows third-party software products such as the CDP program from Alexander Clauss to access the audio CD functions and provide functions beyond those available in the CDAUDIO program/DA.

Data support

ExtenDOS Pro provides support for industry-standard CD-ROM formats. You can access any ISO9660 or High Sierra format CD-ROM as if it were a removable hard disk, switch between supported disk formats without a reboot, and access files of any size. ExtenDOS Pro even provides a built-in configurable cache facility to speed up data access. And with the right drive, ExtenDOS Pro supports single-session or multisession photoCD as well.

Hardware requirements

ExtenDOS Pro requires a SCSI CD-ROM drive connected directly to a SCSI port, or connected to an ACSI port via an ICD AdSCSI+, Link, or Link2 (or equivalent) host adapter.

Please note that other host adapters (including the original Atari host adapter, the Supra, the BMS, and certain early ICD adapters) may not be capable of transmitting the commands necessary to support audio CD and photoCD. If you're not sure whether your adapter is compatible, please contact Anodyne Software at the address below.

ExtenDOS Pro runs on all TOS-based Atari systems, including the ST, STe, Mega, MegaSTe, TT030, and Falcon030. Supported functions depend on the type of drive:

Function	Type of drive
read standard CD-ROMs	Any
read photoCD	Most current drives
audio control/play	Any fully SCSI-2 compatible drive; selected SCSI-1 drives, including models from NEC and Sony
audio copy	Selected drives (see list above)

The following is a partial list of supported drives:

. Apple CD-300e,CD-300e+,PowerCD
. Chinon 525,535
. Compaq 561
. MediaVision Reno
. NEC 25,35/72/77/80/82,73/83,37/74/84,38/74-1/84-1
. NEC 210,3Xe/3Xi/3Xp,3Xp+/4Xe/4Xi
. Panasonic 501
. Pioneer 602X,604X,124X
. Plextor 3024/3028,5024/5028,4plex
. Sony 6211,8022,541,561/55S
. Sun CDPlus
. Texel 3024/5024
. Toshiba 3201,3301,3401,3501,3601,4101,5201,5301

For the latest information on supported drives, please contact Anodyne Software via GEnie (R.BURROWS1), or via the Internet (r.burrows1@genie.geis.com), or write to the address below.

Software requirements

ExtenDOS Pro requires one of the following operating environments:

. TOS (1.0 through 4.04 tested)
. MultiTOS (with MiNT v1.08 or v1.12)
. Geneva (v003/v004 tested)
. Mag!X (v2.01 tested)

Preliminary tests of MagiC v4 indicate that ExtenDOS Pro drives are not 'visible' to the MAGXDESK desktop; however, they are available to any program running from the desktop, including the builtin CLI. This anomaly will be fixed in a subsequent release of ExtenDOS Pro.

Availability

ExtenDOS Pro v2.3 is available now at a suggested retail price of $39.95.
Order from your local Atari dealer, or directly from:

Anodyne Software
6 Cobbler Court
Ottawa
Ontario K1V 0B8
CANADA.

If ordering from Anodyne Software, you may request a manual in French
instead of in English.

ExtenDOS Pro Upgrades

If you are an existing ExtenDOS Pro user, you will be able to upgrade to
version 2.3 AT NO CHARGE by downloading an upgrade file. This will be
distributed to online libraries, including GEnie and Atari FTP sites,
within a few weeks. Alternatively, you may upgrade by sending your
original diskette plus $8 (including shipping) to Anodyne Software at
the above address. Please see below for methods of payment.

ExtenDOS Upgrades

Existing owners of ExtenDOS may upgrade to ExtenDOS Pro v2.3 by sending
their original ExtenDOS diskette plus $20 (including shipping) to Anodyne
Software at the above address. The upgrade includes a manual. Please
see below for methods of payment.

Methods of payment

For North American orders, please make your payment by cheque or money
order, in US$ for shipping to the U.S.A., in Canadian$ for shipping within
Canada. Ontario residents please add 8% sales tax.

For shipments outside North America, please pay by money order in US$.
Please add an additional $2 for airmail shipping.

In response to the below message: I am offering a place on the ST Informer home page for USA and Canadian user group listings by region of the country (West Coast)(SouthWest)(Mountain)(MidWest)(Central)(New England)(Atlantic)(Southern)(Western Canada) (Central Canada) (Eastern Canada). Send your email and indicate proper region, meeting days, meeting city, Person to contact by email and landline, address etc and approximate number of members in 8bit and 16bit. Send email to [stinformer@chatlink.com] and we will make your information part of the user group directory for the USA and Canada. The listing will stay active for one year from the date of submission. We will contact listed person prior to removal. This should make the listings more current than some other sources that I have tried to access.

642. Broken Mega STe

Newsgroup: comp.sys.atari.st
Date: 1996-01-11 00:00:00 UTC
From: HQBA73D@prodigy.com
Message-ID: <4d3lhv$20da@usenetw1.news.prodigy.com>
Source record: 153136

I have a Mega STe that just doesn't want to work. I'm thinking it might be the power supply and I was wondering if any of you guys know where I could get a hold of one for fairly cheap. It could also be my Floppy Drive, which I'd like to upgrade to a 1.44MB. I already have the TOS to do it. I just need thet drive, prices on this would also be greatly appreciated. Thanks in advance.

-
JASON HANSEN HQBA73D@prodigy.com

That is really cheap for the only real professional monitor ever used on
a personal computer. The good old SM124 is the same monitor (or at the
very least, the same case and CRT) as used by NCR for their bank
equipment, before they went to color monitors.

645. mega ste

Newsgroup: comp.sys.atari.st
Date: 1996-01-11 00:00:00 UTC
From: Cyrus <cyrus@lagrange.amd.com>
Message-ID: <30F57FDE.757D@lagrange.amd.com>
Source record: 153139

I am the new proud owner of a MEGA STE. I think it has a 20MEG hard file. I don't know much else about it. I started it up last night for the first time. There's not much on the hard file. One thing I noticed was that the resolution on the sc1224 monitor resembled a CGA display. Can I get better resolution than this?

The machine has no documentation with it - where can I get some docs? What can I do with this machine?

Cyrus

646. Only you....?

Newsgroup: comp.sys.atari.st
Date: 1996-01-11 00:00:00 UTC
From: Jan-Olof Granlund <Jan-Olof.Granlund@sth.frontec.se>
Message-ID: <30F59EF2.7F98@sth.frontec.se>
Source record: 153140

It seems like you people are the only one left in this news group. A small statistical investigation reveals that more or less the same people keep asking each other questions (the same questions). Many times, questions are asked about old stuff or stuff not supported by any company.

It's hard to face it, but the fact is that the strange company Atari seems to be going downhill rapidly. Just take a look at their stocks. This is nothing I'm happy about, believe me.

It took a long time before I gave up, but I finally did when I was trying to sell my TT030 together with a lot of equipment and software. I got just four (4!) answers and what they wanted was only some part here or there. And the prices was (of course) to high (eventhough I had set them to 1/3 of the original cost).

I have no solution for you people still out there. Perhaps if all these "federations" and "clubs", whatever you call them, would join. Together you could invest in production of another atari clone. But then again, Atari people seldom wants to pay, for anything.

I put my TT030 in a corner in room. After a while I guess it will go the same way as my MegaST2, into the closet.

May your god be with you.

Pull both your MegaST and your TT out of the closet, and sell/rent/give
them to someone who will use them. Computers are not vintage guitars!
They're only good (this is true of any computer) as long as someone is
doing a task with them; only as long as SOMEone is producing software for
them. By putting them away, everybody loses, and YOU lose the most!
Any computer depreciates like crazy. A Mega or TT is still a serious step
up for many computer enthusiasts! I use 1987 software, and I haven't used
all its features yet!

From: caffeine@charm.net
Message-ID: <4d2k44$11h@canton.charm.net>
Source record: 153143

For Sale (Or Trade, see below):

Atari 1040STf, 1mb RAM, TOS 1.4 installed, Atari SC1224 Color monitor,
and tons (enough to fill 2 paper grocery bags) of software including
NeoDesk replacement desktop and tons of games & utilities.

Wanted to get at least $250 for the system.

BUT WILL TRADE FOR THE FOLLOWING:

Iomega ZIP drive (external or internal versions)
Iomega Ditto 800 tape backup drive (again, int or ext)
Any other comparable removable harddisk or tape backup unit.

Interested? (Come on, you know you are!) Ring Howie at (410)-653-0512
[in Maryland, where all the damn snow is] or email "caffeine@charm.net".

Can provide a list of all software included if you'd like.

>Does this WWW site support Canadian airport codes? I've tried entering
>YYZ (Pearson Intn'l Airport in Toronto) but get nothing.

When I popped into the project, I thought it did. However it doesn't at
the moment. It has to with the way the weather server has the data. However
it is a problem that is being worked on. I plan on sticking Canada in followed
by european support. I'll probably only stick a few in at a time depending
upon how much time I have to devote to this project.

This would also be a good time to announce that I'm putting an update of
Forecast onto a.a.u.e. later today. It fixes a few of the bugs (menu, window
location, redraw) and also includes the CITIES.TXT file.

So to sum up. Version 0.4 of Forecast will be available today. And
support for the rest of the world with follow as time permits.

: blank page. I am using a 2400 baud modem. Could this be the problem?
^^^^^^^^^^^^^^^^

EEEEKKKK! you gotta be joking!! You'd be waiting all day for a 10k .gif
to be rendered and downloaded.

I've had probs not being able to connect either, but, i found a way
that is not supposed to be the way of getting stik to work.

I log in to my net account using Freeze Dried.
I type at the command line slip
Up pops some numbers and i find the IP Address, i write it down on a piece
of paper.
I quit out of FZDT WITHOUT dropping carrier.
I run STIK.
I enter the IP number that i've been given.
I click on CONNECT
I then run CAB....voila' i'm on the net.....

Try that, it works for me

Yes, this is one of the goals of the Online International TOS Software Catalog. It is available at the Yolo Atari Club website (http://dcn.davis.ca.us/~dmlarson/yac). It hasn't progressed as far as it should have though, due to an apparent lack of interest on the part of the Atari internet community. For it to work people need to email information about programs that didn't make it on the list yet. Its supposed to be a sort of interactive thing, you see.

Even during those hours (8am-8pm over here - quite handy :), the majority
of (the atari section anyway) hensa gives me little messages telling me
that I'm not allowed to access the files outside of the given hours,
despite the fact that I'm right in the middle of the allowable time.

> CAB only displays a blank page...

Try the tip that Paul Womar gave here a few days ago (thanks Paul!). In short:
1. check if your cache path is set correctly
2. create a file called 00000001 (yes, seven zero's and one one) and put it in the CACHE folder. You can create the file with Selectric's New Items-option, or use a texteditor. Doesn't matter if the file contains zero bytes or more, it's just the filename that matters.
3. start CAB use the URL menu option to type in an address. Doesn't matter which URL you use. After you sent the URL, CAB comes up with the infamous blank page.
4. Now go to the Clear Cache option and empty your caches (you wil loose all data in your cache of course). After this, you won't be plagued by the error message 'can't find file 00000001'.

BTW: can someone tell me what is the meaning of TOS error # 38 ? Has it to do with incorrect loading of fonts?
(maybe a tip where I can find a FAQ-list about TOS errors?) Thanx.

Marc.

I too would like to see an ST faq, any ideas anyone?

>1) I know there's basically a difference between ST-RAM and TT-RAM (aka
> Fast-RAM), but I'd like to know what exactly that difference is.

The actual physical RAM is a actually faster (obviously) and it is treated a
little like extended Memory on PC's basically, not everything can use it but
most serious programs do or can be forced to. Many forced programs will not be
able to treat it as one big block you can normally set flags to run in TT Ram
and to use TT Ram memory or not as the case may be, does that explain it?

>2) If I buy a Falcon (hopefully soon!) with i MB of RAM (i = {4,14}), is that
> ST-RAM, TT-RAM, or some combination of the two? Comments I've seen here
> have hinted that it's ST-RAM and not TT-RAM.

I understand that to be the case, it is treated as one big block.

Anyone know of a good Editor/Librarian for a Roland JV 880 that will run in a 1 Meg 1040ST? I don't want to spend much, so it is shareware or something, that is fine. I would appreciate any leads. Thanks.

Tej Gill

Yes. I have a program which generates a program to put into your auto folder.
It allows you to define the whole keyboard. If this sounds like what you want
I can email it to you...

I have a 115 Mbyte Minix partition, which seems to work ok.
AFAIK, the sector size on the drive (formatted by AHDI) is 4096 bytes.

I have an Atari 1040ST without a hard drive, that I haven't used for a long time. It is just collecting dust.

1. Where can I get software for it?

2. Can I get software on the Internet?

3. How can I get software into it?

4. Is a floppy disk that is formatted for the PC, with software on it, readable by the Atari?

5. Should I used this thing as a paperweight and forget it?

Please respond via email to swett@interramp.com

Thanks!

A similar thing happened to me aeons ago.

I'd just moved the computer, and having switched it on, the colour screen
was all white. Turns out that I'd knocked the contrast (or was it
brightness?) knobs to a new setting.

But I could be wrong.

:>First of all, for most computing tasks, RAW processor power is not
:>necessarily relevant. Most if not all IBM compatibles, especially those
:>not running 32-Bit operating systems (Windows 95 not included!) are
:>plagued by operating system limitations that severely cripple the
:>machine.

I'm sorry but I have to disagree, a fast general purpose CPU is essential for
'most' computing tasks. After all one needs a fast CPU to drive all that
fast graphics and audio hware ;-)
(Try telling someone continuously recalculating a large spreadsheet that
CPU power is irrevelant.... or someone doing 3d rendering... or someone spell
checking their thesis.... etc)

:> This is compounded by the limited operating capacity of the bus
:>in clones, which for the most part, operate at standards that are almost
:>a decade old (PCI not included). This is slowly changing, but many cards
:>and their slots are still TOO slow. Mhz is irrelevant, especially when
:>considering all the extra work clones have to do to move memory around,
:>still being plagued by the 64/640k limitations, paged memory, etc... a
:>100mhz IBM350-100DX4 is _slightly_ faster at some things when compared to
:>the Falcon, but most things are _much_ slower. It is not a matter of raw
:>power here, because the DX4 should really be faster, but in practicality
:>- when it comes to trying to accomplish a task, it usually is not.
:>I'm not saying that the Falcon is "faster than a Pentium", but I would
:>imagine there are still things that the Falcon can do better. I have yet
:>to see any platform that can do 8, let alone 16 tracks of digital audio
:>without additional hardware. I personally need that. I have to assume
:>that the PC's innability to manage more than 4 tracks (last time I
:>looked) was related to the bus not being able to manage that kind of
:>traffic. Merely an assumption.

Well I've written a 24 track DSP digital audio routine which uses every ounce
of the DSP 56001s power... my Pentium can do this with 50% cpu time left...
for digitial recording the falcon has the advantage of running a single
tasking OS - which means you can guarantee a continuous flow of sound.

From: gregor@shelly.goldengate.net
Message-ID: <1b7cc$14391d.79@goldengate>
Source record: 153019

This may or not be appropriate to post here but here goes...

Does anyone know if Gadjits software is still in business? I've been
running an editor program for one of synths and the disk seems to have been
damaged. Fortunately, I installed it on my HD and it is still operational
(the write protection scheme involves inserting the original disk and
this still works) but I can't read the other files on the disk. I get the
ever thrilling "Drive A Does not respond" Message. No big
loss on this end, but I'm concerned that eventually the disk will be so
hosed that even the write protection scheme won't work.
The Disk itself says "Musicsoft....Librarian (c)1988 Gadjits Software".
I bought it second hand, so I'm at a loss! any suggestions?

If you have diamond edge, or another sector editor such as discus or knifest,
look up the directory entry in the FAT table, and edit it to an acceptable name
of the same number of characters. Then you can delete it as normal.

Alternatively you can zero the partition but since the tools to do this are
also in diamond edge or discus I am not sure if there is much point :-/

Hope this helps...

I don't really know to much as I see no use for it, I couldn't care less if someone wants to tap the drivel that I write to people. Basically you enter a pass phrase into the program and out pops 2 keys (big strings of "rubbish" ASCII text) one is your private key that you guard with your life, the other is your public key which you send out to everyone who might want to send you something. They use your public key to encode stuff and you use your private one to decode it. Thats about it really, just download it from somewhere and look at the docs it's only a small program anyway.

Maybe a more elegant way is to use a script. Mine goes like this:

```
FIND = login:
RESP = slip:my@login| [ the "|" generates a return/linefeed]
#
FIND = Password:
RESP = guesswhat|
#
FIND = ) to [after "to" follows the IP-nr, you pick it up with
RESP = $GET_IP| [the GET_IP command, and it is automatically
[stored in STiK.
```

[...]
: My main use for this new ST (which has 4 megs of ram and an
: external 720K floppy), if everything works out, would be as an X windows
: terminal. I'll be using a nearby Linux box as an X server.
You'll almost certainly need a hard drive. While I suppose it would be
theoretically possible to run an X terminal from floppies, I wouldn't
want to do so.
: So, I was wondering if any of y'all had any experience in doing
: such a thing. From the messages here and what little I could find on the
: web, I'd probably need MiNTOS -- but where do I get MiNT? (Yes, I've been
: out of touch from the Atari world for a number of years now.) Are there
: any other possibilities (Minix, A/UX, Linux 68000, etc?)
Yes, you'll need MiNTOS to set up X Window. Again, this system will
expect a hard drive. And for a 68000-based TOS machine, MiNT and its
various addons are the only choice, AFAIK, if you want to run X Window.
There are distribution kits available (notably the TAF one, which
includes an X Window setup). I wouldn't know where to get them, since I
built my system piece by piece from software downloaded from
atari.archive.umich.edu and its various mirrors.
: Also, would it be possible to boot from a floppy and mount a Minix
: partition from said nearby Linux box to use as storage?
Maybe, but you probably wouldn't want to try it. Aside from sheer floppy
storage limitation headaches, it'll be slow. Every time you want a
directory listing, you'll have to download ls (~17K, IIRC), which will
take time over a 19200 bps null modem link (I'm assuming this is how
you're planning on connecting the machines together).

If I'm not mistaken, a power supply from any 1040ST or Mega will work. So look for one that's been written off for other reasons. Perhaps $10 CDN would get you a power supply, if luck is with you. A replacement disk drive unit should be in the neighbourhood of $50 CDN.

: for the past few months--- it seems to work best w/ UNIX connections to
: the net...

I've tried about them all, and this far, nothing outruns Connect 2.46E.
It just works perfectly on my Falcon. Score: 9+/10. A bit tricky to
use in the beginning, takes some time...

The latest version of Flash might be great, too.

STalker is simple, and has some trouble with ANSI-emulation (at least
3.01 has - there are newer versions available), but it's fun to use,
and pretty reliable.

STorm is too limited for my taste, though the idea is o.k.

For ST, STarCall is a pretty good choice. Its emulations are
very good, and despite some bugs here and there, some people
like it a lot. Its internal Z-modem doesn't work very well,
so I'd advise using some external protocol instead.
It's German, and available as shareware in some ftp-sites.
Can't remember where exactly, sorry.. =(

Try: ftp.uni-kl.de, ftp.uni-regensburg.de, ftp.cnam.fr

Greetings,
Tommi

I have for sale one copy of MagiCMac v1.2.3 with an English manual for
80 UKP.

For those of you not in the know this package enables you to turn an Apple
Mac (either a PowerMac or a standard Mac (68030 CPU or better)) into an Atari
compatible mean machine!

It runs Atari specific software faster than the equivalent Macintosh native
software on the same machine and is a great piece of software for those of
you serious about your Atari system.

The reason for the sale is someone made me an offer I couldn't refuse for my
Quadra 840av, and so with the proceeds I have bought a TT system that will
help me with my programming under Lattice C.

Please reply if interested to spencer@mettav.demon.co.uk

Spencer

1. If you live in the USA/Canada:
Download PGP2.6.2 from MIT or a USA/Canadian bbs. You are not allowed to
export this version.
2. Outside:
Get PGP262i (note the 'i'). If you download it from a non-USA bbs/ftp
archive, then nothing illegal has happened.
Incidently, if you should find a copy of the USA version outside of the
border, it is not illegal to download or use it (although the
international version might be a bit faster). The only one who could be
prosecuted is the one uploading it from the USA.

Announcement: PGP2.6.3i is due in a few weeks.

I need a monochrome monitor. Would like to trade a bunch of software i
have right now plus pay half of shipping, but would buy one if the price
is right.
please contact me if you have one, especially if you would like a list of
software (mostly games, old productivity, magaizine cover disks, and some
books on programming, but a lot of it is good software)
thanks
rhett@wpi.edu

I've never been in a pro-level studio running a PC for HD recording yet,
If they had one resident I'd strip it out and plug up a Powermac for the sesh.

I allways use a bog ST for my own non HD recording. PCs good for games and
spreadsheets though. Otherwise I think PCs running Windows are bollocks:
16 IRQ lines? 64k resources? bit of an old joke really.
And in the last PC Labs test, W95 slowed existing apps down by a further 30%
WABI also outperforms windows by 50% on the same machine with the same
software.

These are my own opinions.

Yes it is one of the best! Funny way of describing that wonderful ProTracker program though, it is basically a mod player and editor. The package comes with ST (mono), STE (Stereo) and a wonderful little program called BackTrack that lets you play mods in background on mono (and colour?).

I really don't know to be honst, the ZIP should work with any Parity supporting
device, the termination power will be supplied by your HD. I it supports parity
it supports ZIPs I expect it does but I'm not sure, maybe you could check your
parity jumpers and see if they are set on and then your card does support it if
not set them on and give it a go!
NB: I say "should" I really meand "will" but should that 0.0001hance of
failiure appear I don't want you to sue my ass ;-)

PGP. Pretty Good Privacy , is a public key encryption system, that is to say
it uses a private key (unique number a bit like a password) to decrypt data encoded with a public key. the private key is kept by the recipient, who can give or distribute the public key to
the transmitter/s of the data without endangering the security of the cypher.

The NSA, a yank snooping paranoid organisation(IMHO), (probably reading this now) tried to ban its
use or distribution as it meant they couldn't snoop other peoples private mail if it became too prolific. Too Late :)

>
> --Michael Burkley

The SCSI version is 5 times faster :) (Parallel is 20Meg/Min, SCSI is
60Meg/Min). I reformatted my Megafile-30, ICD insists on formatting it
with level-2 interleave, which results in it running at about 256Kb/S, I
reformatted it with NO interleave, and got it up to about 470Kb/S. Crazy.

So, now the ZIP drives are only twice as fast as my hard-disk :)

705. ST as X-term?

Newsgroup: comp.sys.atari.st
Date: 1996-01-12 00:00:00 UTC
From: "J.D. Falk" <jdfalk@cyberNOTHING.org>
Message-ID: <Pine.BSI.3.91.960112054352.378A-100000@cais.cais.com>
Source record: 153070

Within the next week, I'll finally have an ST capable of running
stuff released within the past six years. This'll be my second ST; the
first, a stock 520STfm I bought in 1986, is still with me. It's kind of a
shame to replace it before its tenth birthday, but hey, it happens.
My main use for this new ST (which has 4 megs of ram and an
external 720K floppy), if everything works out, would be as an X windows
terminal. I'll be using a nearby Linux box as an X server.
So, I was wondering if any of y'all had any experience in doing
such a thing. From the messages here and what little I could find on the
web, I'd probably need MiNTOS -- but where do I get MiNT? (Yes, I've been
out of touch from the Atari world for a number of years now.) Are there
any other possibilities (Minix, A/UX, Linux 68000, etc?)
Also, would it be possible to boot from a floppy and mount a Minix
partition from said nearby Linux box to use as storage?

Any advice that any of y'all should feel like passing my way would
be much appreciated.

I need some help...

A buddy and I just got ahold of a Mega STE with Digital Master hardware from Hybrid Arts. Unfortunately, a great deal usually has its downside, and our is that the system is without the software. Upon searching for Hybrid Arts number, we discovered that Hybrid Arts is sadly no-longer. What I need is somebody who will give me a copy of the interface software...I will gladly pay for disks, and shipping...and of course a fee if needed, but I have no other options. Either this is a fantastic system, capable of 4-tracks (we have two interface modules)...or its just another ST hanging around. PLease email me if you can help!

Recently I installed MiNT and MiNT-NET on my falc. I found that there is a
complete MiNT installation kit (in ENGLISH !!) located at
//ftp.cnam.fr/pub/Atari/Mint/Kit_Unix

I got MultiTOS up and running in less than 2 hours. It comes with installation
for minix filesystem & multiuser mode (init/getty etc) which is needed for
MiNT-NET installation. Mint-NET took another 2-3 hours.

HTH.

I found CPX' s for the HP printers I believe in cnam.fr.
These CPX are great as they incorporate all the functions
of the HP EXPLORE SOFTWARE.

The CPX's were written by German friend Donald BorK

I have not been able to find his e. amil address, and would
like to take this opportunity to thank him for this great work.

I also found on cnam.fr under printers some HP drivers to be used
under GDOS etc. One of them prints IMG files to disk.

I hope you find this helpful.

Cix now provide internet access. I very rarely get an engaged line. You
also get the use of CIX conferencing (including a few good Atari ones).
Their PoPs now provide something like 80% local access in the UK.

I noticed there is a new Dungeon Master game available for the PC. How does this compare to the classic Dungeon Master's I & II for the Atari ST?

Is it good enough to warrant a port to the Jaguar (assuming the powers that be are still looking for Jag titles)?

715. *** DIGITAL RECORDING WARNING! ***

Newsgroup: comp.sys.atari.st
Date: 1996-01-12 00:00:00 UTC
From: afn14016@freenet.ufl.edu
Message-ID: <4d67l3$r53@huron.eel.ufl.edu>
Source record: 153080

DIGITAL RECORDING WARNING!

First of all let me inform you that I have been a music teacher for over 17 years and that I have completed a CD "FRIENDS" which was recorded on the Falcon 030 computer. This CD will be released at the Habana Cuba Guitar Festival in May.

My story:

A while ago a friend from Miami came to my studio and had the opportunity to see Logic Audio on my Falcon. He was very impressed with the Sound Tools's like functions, and told me that at the time he could not afford a system like this. He also expressed that he was not ready for digital audio.

Time went by and I got news that he had gotten an IBM 386 from a friend. He wanted to built his digital studio by expanding the 386 little by little. His idea was that he could spend a little now and little latter and soon get the system running. My advice was, that by the time he got the system set up the expenses would be much greater than getting a new or used Falcon.

Well, there was no way to change his mind as he wanted to run also some nice looking DTP programs on his IBM system (these so called nice DTP cost $40.00, so you know how good they really are!)

He had also read the review about this nice XXX program that could do 4 tracks on the IBM. Well, he had not actually seen the program. I told him that one of the most important things about a computer program (if not the most important specially digital recording) is that the program is reliable and stable. But he did not listen.

To make the story short, it has been a year now, he has updated his computer to a 486, with windows, which now he has to update to Windows 95 and his computer to a Pentium. He has spent money and time and He still has not recorded even a 30sec. Jingle!

I tell you this story to show you how powerful advertisement by the XXX system is. This friend had a Mega ST and decided to go to the IBM to suffer much.

My advice is:

If you are planning to get into Digital Recording (multi track digital Audio) get a Mac or a Falcon.

Macs and Atari (Sound Tools) have been used in professional studios for many years.

I have seen Studio Vision on a Mac and it runs great. The Falcon was
a good choice for my because the hardware needed do do 8 channels at 50kHz
higher than CD and DAT was already installed. The software was designed
for the already included DA AD converters, and I was sure it would work!

In other computers this is "a little" more difficult to accomplish
as there are so many possibilities;

different card available, and with this comes the quality and specs
different drivers available
system requirements etc.

While on the XXX computer digital recording can be possible, there
is much more opportunity for the journey to become a night mare, specially
for professional musicians who most of the time have never used a
computer.

I feel that it is my obligation as a musician and as an Atari/Falcon
users to inform my friends that the Atari Falcon still is a very
affordable and sound choice when it comes to music. We need to make Atari
users aware that they can upgrade their computer to nice Audio and
Graphics and stay with TOS.

Where else can you get an 8 channels digital audio recording system
already set up for $1200.00!(may be less)

Logic Audio and Cubase Audio are top of the line programs. They were
designed for the Falcon and Mac. My choice has always been get quality,
get the best. For digital audio Mac is great and the Falcon and its good
OS a very fine choice.

For businesses, yes get and XXX computer but music my friend I tell you
get a Falcon or C-Lab Falcon. It works. Which is the only computer that
still comes with MIDI ports a a standard? by the way old ST and C-Lab
Notator still a fantastic MIDI set up with automated music notation.
Music is notated as you play very fast on a 1 meg Atari ST! You have to
see it to believe it.

Well, I am sorry about this articles's title. Digital audio is a
very safe thing to do on the Falcon 030.

P.S. xxx computer is IBM compatible.

By the way WHO SOLD THE PC (personal computer) to the IBM WORLD!

They are all Personal Computers aren't they?

719. STIK needs to support ppp.

Newsgroup: comp.sys.atari.st
Date: 1996-01-12 00:00:00 UTC
From: stuart@cs.ualberta.ca
Message-ID: <4d6lal$a4c@scapa.cs.ualberta.ca>
Source record: 153084

I hope that STIK decides to support ppp soon.

Our accounts at this university cannot use slip, as there is a security hazard associated with it. We now have to first login, and then initiate a ppp session. Unfortunately, this sort of wrecks my former slip usability, since stik doesn't do ppp. I hope they do it in the next upgrade, as most decent packages in this area do.

It looks promising, though. Is there a way to display colour gifs in the browser as well? Just wondering. I never actually got to use it much, since as soon as I got it set up, I found out that I couldn't use it. The gifs on the included files looked as though they were in black and white.

Dave

The whole setup, all programs that are part of KGMD (Knarfs German MiNT Distribution) are in english ! It's only the installation doc's and the KGMDinst.tos that are in german. However, everything is stated very clearly, so with school german and maybe a dictionary you probably won't have any problems.

Cheers Peter

Yep you need an FPU but worse an 030 ..i.e PAK CPU upgrade. Not worth it
IMO ,get a TT or a Falcon is cheaper in long run.

Yeah, pretty nice isn't it? I have the impression of this being one of
the most friendly and helpful groups on the usenet!
Unlike most groups, people don't get "flamed" for nothing here, and
simple, trivial questions aren't criticized.

>It's hard to face it, but the fact is that the strange
>company Atari seems to be going downhill rapidly. Just
>take a look at their stocks. This is nothing I'm happy
>about, believe me.

Well, we've never really had any support from Atari, have we?
As long as people have, and is using this line of computers there will
be this group. I for one have no plans to sell my STe. I'm sure there
are others out there who think their ST/Falcon/TT is a great machine
which they'll keep using for many years to come.

>It took a long time before I gave up, but I finally did
>when I was trying to sell my TT030 together with a lot
>of equipment and software. I got just four (4!) answers
>and what they wanted was only some part here or there.
>And the prices was (of course) to high (eventhough I had
>set them to 1/3 of the original cost).

So why did you sell it if it wasn't worth it?
The sad but true fact is that the Atari line has never been "top of
the line" stuff as in popularity. Although it's a great and powerful
machine, the majority of people buy PCs (because "everyone else
does"). If I was you I would keep it, but then again that's your
choice.

>I have no solution for you people still out there. Perhaps
>if all these "federations" and "clubs", whatever you call
>them, would join. Together you could invest in production
>of another atari clone. But then again, Atari people seldom
>wants to pay, for anything.

There are already a few clones out there. C-Lab's Falcon Mk.II,
the Medusa and the Eagle come to mind. Have I missed out any? I have a
feeling there's one more which I forgot the name of...

Well, as for "clubs"- I guess this newsgroup could sort of be seen
upon as one ;-)
Yes, what you're saying is a good idea. There are many small Atari
clubs out there. Small in numbers of people, but serious.

The following items are for sale so make me an offer, I won't laugh.

VideoMaster digitiser and colour splitter for the Falcon.

Stereo Replay sampling cartridge for STFM or STe (boxed and as new).

Vidi-ST video digitiser, this is only the digitising cartridge and no
colour splitter so £20 is the suggested price (inc. P+P)

View II, file viewing program. Designed for integration into the desktop.
Handles many file types (SEQ, pictures, samples, text, etc.)

Timeworks 2 plus two manuals on Desktop Publishing with it.

Epson FX80 emulation cartridge for DeskJet, Deskjet+ and Deskjet 500.

Printer Port buffer module, made by Paul Rossiter for HP Deskjet owners.

Warp 9 screen accelerator software for STFM, STe.

FontKit Plus 4, font editing package.

E-Mail me with any offers for items you may want.

Spencer

732. Do you need an SM-124 Mono Monitor w/ Monitor Master switch box?

Newsgroup: comp.sys.atari.st
Date: 1996-01-12 00:00:00 UTC
From: krieg@miller.cs.uwm.edu
Message-ID: <4d6d7v$bv6@uwm.edu>
Source record: 153097
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I need desk space, and I don't use the mono monitor anymore since I sold
my Spectre GCR.

Here's the deal, I would like to trade my mono SM-124 monitor *with* the
hard to find Monitor Master switch box for a decent composite monitor to
attach to my Atari 8-bit. I've heard the Commodore monitors (1702?, 1902?)
are pretty good to use with the Ataris, so I'm looking for those or something
comparable.

733. HP 660C driver found!

Newsgroup: comp.sys.atari.st
Date: 1996-01-12 00:00:00 UTC
From: thietavu@news.abo.fi
Message-ID: <4d6rit$3dp@josie.abo.fi>
Source record: 153098

So, I finally found the driver for HP DeskJet 600..850 models =) !

It's called "HP660C.ZIP, and was found from some ftp-site (maybe ftp.uni-regensburg.de). It's French, and thus quite hard to understand. Unfortunately, no documentation was included at all (strange!).

This package contains a CPX-module, and a HP660C.SYS -file.

It was a BIG surprise for me to find out that this program seems to co-operate with NVDI 3! Unbelievable, since most XXXXX.SYS -drivers only work with SpeedoGDOS 5, or 4. I still don't understand how and why, but this strange driver hooks itself into NVDI printing system, and can be configured by using its own CPX-module.

Virtually _everything_ can be set. This CPX control panel really shows what can be done.

This is a GREAT utility, I think... My only complaints are for the lack of documentation, lack of English language, and some problems with using other than the best 600x300 color print quality.

When I used "normal" or "econofast" modes, weird things happened: it seems like black ink was printed using 600x300 DPI, but color ink using 300x300 DPI... I'd like to know, if this is a bug somewhere - or perhaps I just configured something wrongly (the language problem..).

Anyway, THIS is the solution we've been looking for. Now, all we need is English version, some documentation, and perhaps some bug fixes... Then this program is well worth some shareware fee, I think!

Tommi

734. Reset Vector ?!

Newsgroup: comp.sys.atari.st
Date: 1996-01-12 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <821565834_OASIS_@phil4.demon.co.uk>
Source record: 153099

This is going to sound a bit dodgey, and probably isn't the best place to ask, but it'll do for a start !

Does anyone here know how to go about using the reset vector. From what I can gather, there is an address in memory which stores another address, which contains code. When the reset occurs, the computer looks at the first address, and then executes the code it points to. Am I on the right lines here ???

The reason I ask is because I want to write a program that surpresses a reset, and continues the program, so that a resolution change for instance is possible (from low to high or vice versa). If this doesn't work then I may produce a little warning message for others who use my computer, so that they don't reset programs without saving their data.

I'm not really interested in how to program the suggestions so much as how to change the reset vector and use my own code, and how limited the vector is. The programming is my challenge !!!!

Thanks for any help in advance

Phil H

735. Atomik 4.0 ???

Newsgroup: comp.sys.atari.st
Date: 1996-01-12 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <821492202_OASIS_@phil4.demon.co.uk>
Source record: 153100

I found this the other day while using Atomik 3.5:

"ATOMIK IS ACTUALLY THE BEST COMPRESSSION SYSTEM EVER CODED ON ANY
COMPUTER AND I THINK THAT I HAVE REACHED THE LIMITS OF THE STO PACK
SYSTEM BUT NOW I AM WORKING ON A PACKER WICH WILL BE CALLED ATM 4.0

THIS WILL BE A PROFESSIONAL PRODUCT WITH MANY MORE OPTIONS THAN ATOMIC
3.5 INCLUDING:

1) TOTAL HARDDISK ARCHIVER WITH DIR
2) TRACKERS MODEULES COMPRESSOR ~(50%)
3) MULTI-DEPACKER (ICE, JAM, POMPEY ETC).
4) AUTOMATIC OTHER PACKER DECOMPRESSOR AND NEW COMPRESSION WITH ATOMIK
4.0"

This was written 27/1/92, by Altair.

Doies anyone know wether this program became a reality ??? or did it
go the way of many good ideas ???

BTW: what is STO packing ???

Thanks for any info

:
: Within the next week, I'll finally have an ST capable of running
:stuff released within the past six years. This'll be my second ST; the
:first, a stock 520STfm I bought in 1986, is still with me. It's kind of a
:shame to replace it before its tenth birthday, but hey, it happens.
: My main use for this new ST (which has 4 megs of ram and an
:external 720K floppy), if everything works out, would be as an X windows
:terminal. I'll be using a nearby Linux box as an X server.

I am also interested in this. I would like my ST to display Xapps running
on my linux box. Is this possible on a stock 1040Stfm?
I am not interested in MiNT etc. just a program that listens to an X server
and displays windows and returns keystrokes/mouse to the server etc.

Yes, Papyrus is excellent compared to almost anything available..

There are some other great German WPs available (Tempus Word Pro,
Signum! 4, Script..), but none of them is available in English, AFAIK.

It looks very promising indeed. Cab certainly display colour gifs.
Just go to OPTIONS and change the DISPLAY parameters from monochrome
to colour. That's all.

>
If you click on the file it should download itself into the cache. After you've finished browsing you'll have to go looking, as I think CAB renames the file. To help you i your search, you'll find the extension stays as PRG or TOS or whatever. I remember discovering some unlooked at JPEGs in there once upon a time before I'd finished configuring fully, all present, correct and unlooked at. I would assume the same would happen with any unrecognised filetype.

>
I had that same problem. It would not work at all. I could read into a
directory, but either nothing would be there, then a crash, or it would just
crash. Plus, my hard disk and it would bump heads. I had to send it back.
Sanyo and I just don't get along...

746. DIP & MiNTnet problems..

Newsgroup: comp.sys.atari.st
Date: 1996-01-13 00:00:00 UTC
From: thietavu@news.abo.fi
Message-ID: <4d99qd$jd7@josie.abo.fi>
Source record: 152911

This is silly: for some reason, I can't install DIP-337 SLIP package
for MiNTnet at all... I installed MNet from the Canadian MiNT/X11
distribution package - and the installation script "install --firsttime"
just gives mystic error messages: "file not found", and such. I can't
even figure out _what_ is not found and why!

It seems, I once again lack some Unix-related knowledge - but setting
a SLIP-based MiNTnet can't really be this difficult, can it?

Should this be simple, or is there some trick? Where should I have
the DIP-files before installation? TAR seems to create a directory
called "dip-337uir", and put the files there.

Should I have usr/bin available, or just /bin - or both? Now there
are both directories. Could it confuse the installation script?

Sorry for perhaps silly questions, but for me Falcon has been a GEM-
computer: I know very little about the tricks of MiNT... =(

Thanx for any help,
Tommi

747. Papyrus Printer Driver Wanted

Newsgroup: comp.sys.atari.st
Date: 1996-01-13 00:00:00 UTC
From: johnmoon@connexus.apana.org.au
Message-ID: <4d8amd$jc3@preeda.internex.net.au>

>I'm getting increasingly frustrated with the lack of service from Demon

You aren't the only one, the demon support newsgroup was *packed* with
pissed off people messages. !!!!!
>who were always the recommended IP for Atarians (cf. ST Format etc). Any
>one out there in the UK like to point me into the arms of soomeone else
>who'll welcome me AND provide a decent service (ie. phone not engaged,
>news server available during non-peak phone rate hours) with local POP in
>London?

Local Pops in london shouldn't be a problem, try CIX, recommended by
those at Atari World.

The actual Internet connection is slightly more expensive but
downloading news and mail is faster (as its compressed first) and many
people sware by it !

>the product is another story.
>
>
>Now after what we have seen here lets ask. Who really is making GAME STUFF?
>
>Raymond.

I can see your point, and it is to a degree quite valid. However I'd
like to point out the fact that in this newsgroup there is a small
discussion about why HP printers are a pain because the control panel
has been removed. What is happening there is a similar thing to what
you have suggested. Technology has moved on, and most people who buy
their printers have PCs so they make the printer for PC/Mac. This is

a very similar thing to what you are suggesting, however we all winge when HP do just that.

Losing sight of backward compatibility means that you are in great danger of doing just what a lot of PCs have done/are doing and that is producing software that will only run on the latest machine produced that year. Its ok for the programmer/software house because there are enough people to support the product, but the number of people who can't run it 'cause they haven't got pentium pro 150Mhz CPU is quite large, and they all get left behind with a comuter only a year old thats worth less than the paper the manual is printed on.

Also by saying that most serious ST users have converted to Medusa, TTs, Falcons et al. is b*ll*cks. Just becuase people haven't got enough cash to buy a falcon dosn't mean they aren't serious about their computer. I'm deadly serious about my atari, but I haven't got enough cash to go forking out for a new falcon with after burner, or Blowup Fx.... And I'm sure there are plenty others like me (and I know some of them !).

There is no reason for a programmer to deliberatly go out of his way to write a program that must have 030 and DSP etc. And by killing of programs that will run on ST, you'll do the Atari scene a lot more damage than you really think. After all the amount of software written for ST, in terms of Pd, shareware and comercial reflects how many ST computers there are out there...

Its quite easy to spot a PGP file, first off it doesn't look like
ASCII email ! and second it starts :PGP V..... and so sifting
through the data isn't too tricky. To be honest I'm not sure what MI5
get upto all day long, but I suspect they would like the ability to
read messages.
>
>2) Do you think they would have enough sense to "sabotage" versions of PGP on uk

I use protext (old version 4.2 from STF coverdisk, and then
registered). Personally I like it becuase it is lightning quick. Its
not quite as friendly as others but the speed makes up for it !.

Other WPs like Papyrus and the rest seem to much like DTP progs for
me, I use a dedicated DTP prog fro DTPing (Calamus) and dedicated WP
for WPing (Protext).

Sharewarewise Marcel is pretty good, and as a text ed rather than a WP
everest is pretty good.

>
>In the terminal program end, I've actually resorted to using FLASH 1.6

In reading Netscape 14, Jan '96 It suggests that US commerce, Trade
and Customs officials are going to join British and European law
enforcers to stop illegal use. And the American bod interviewed
suggested that they were aiming their investigations into europe. So
who and how we will be charged is a good question.

>the TT's motherboard with very little modification.

The PSU is like a PCs, it is all cased in a metallic box, which houses
the fan unit as well.

The power switch went a while back and was repaired. But The repair
chap tried to get a new PSU which would have cost about 70quid and is
specific, Ie. not really advisable as an STFM modified version (no
fan).

Network ST International Association (NeST).

==========

Press Release Issue 012 (24/09/95)

What is NeST?

NeST (Network ST) is an international network based on FidoNet technology, dedicated to the Atari range of computers, in particular the Atari ST, TT and Falcon. The aim of the network is to provide messaging facilities to all Atari users the world over who are interested in the world of communications and in the ST. Eventually it is planned that NeST will extend to virtually every country in the world, however NeST now links the following countries:

United Kingdom

Canada

The United States

Germany

The Netherlands

Australasia

Italy

France

Spain

Sweden

Czech Republic

Poland

Norway

Denmark

Luxembourg

South East Asia

Belgium

This is by far the largest Atari dedicated network in the world, and it is growing rapidly, with an average of a new country coming online every couple of months.

NeST members work closely together to generate a good atmosphere; within NeST you will not find any political battles, something which can't be said for a lot of other alternets. NeST also has a habit of collecting programers from every walk of life, including some very well known names, who are either members of the network itself, or affiliated with it.

NeST has a wealth of message and file echos, ninety percent of which are echo'd round the world, and replies can be achieved within three to four days. The message echo's cover a terrific range, running from software support (LED, JEKYLL, JetMail, MakeDiff, Semper, etc), programing (GFA, C, assembler etc), and general interest echo's like the common room where chaos rules, and users let off steam, and the Q&A echo where weird and wonderful queries are posted. We also have direct contact with the Atari publishing world and have contact echo's for both ST Format and Atari World magazines, with many members of the editorial staff online.

Or if you are looking for something a little different why not take an interest in Space Empire Elite? The game runs throughout the network, using special programs coded by NeST members to coordinate and send inter-BBS attacks through the network.

NeST allows the use of almost any mailing software, be it F-Net/Crossnet, or fidonet technology, to be used to collect mail, giving a very flexible system of mailing. Point systems are given rights too, if they take a

'Pvt' address in the master NeSTList, they are allowed full participation in the network, including taking part in votes on major changes within the network,again this is rarely allowed in other networks.

One item that worries some users, and sysops is cost, that is network fees for linking into the network itself. With NeST no such fees exist, as each member works freely to gain the best connections, minimising mail costs as much as possible.

NeST may be accessed via the following methods:

- Dial up (log on) access via a NeST BBS and a comms terminal.
- Via .QWK packet reader at your local NeST BBS.
- Via fidonet point or node access software, again via your local NeST BBS.

It should be noted at this time that NeST can not currently be accessed via the Internet.

NeST also has available all the files taken from the FAN (Final Atari Network) file echoes. FAN is often the first place to find new files, many times directly from the authors themselves and has links to the respected MausNet network in Germany.

NeST users also have the ability to access InterNet email and newsgroups via the NeST Internet gateway located at 90:100/106.0@nest.ftn (@nest.demon.co.uk).

If you want to join a network that's friendly, fun, well informed, and concious of what's going on, well why not try NeST, I don't think you'll regret it!

For more information contact:

Daron Brewood - 90:90/0.0@nest.ftn

- dbrewood@nest.demon.co.uk
- dbrewood@cix.compulink.co.uk

I look forward to hearing from you...

Daron Brewood - NeST Coordinator

I can't get STiK to work with MagiC4 on my Falcon. STiK connects OK, but when
I try to use CAB or telnet everything just freeze. I have HSMOD6 installed.

Does STiK work with this setup at all? It works fine under TOS.

: Hi, I need some better tracker for making mod's.
: Now I use NoiseTracker 1.5 - it's old and has some bugs.
: I would be very happy if you let me know about
: some musical software for my old 520ST withou B&W monitor.

There are two choices:

ProTracker ST is an excellent MOD editor. I use it myself. It's got some fantastic editing capabilities (but unfortunately to way to overlay/undedrlay tracks) and a built-in sample editor (mixing samples doesn't seem to work though). Apart from those few problems it also does not support the Extended E command set (though neither does Noisetracker 1.5) whic is a bit annoying if you want to use them. (And there are some usefull commands in that subset) It also supports ProTracker extended tempo (BPM) settings. This one is Shareware.

Another one is Audio Sculpture. THis one's commercial, and features a lot of intersting features that aren't found in other trackers. (AUtomatically adding echo to one or all tracks, for example) It supports the FULL command set, including the E commands, but has more than its share of problems. FIrst it only runs from floppy, and if ou have a hard drive, it wil only work with drives formatted with Atari's HD utilities. (It doesn't recgnise my ICD-formatted drive) Second, sample looping doesn't work properly with it. Third, its tempo settings are a little too slow -- playyed back with another MOD player, your song may end up being ill-timed. Fourth, it takes forever to save a MOD.

If you're short on RAM, stick with Noisetracker. IT's the least RAM hungry of them all. ProTracker does take up moore RAM, but dynamically allocates RAM as you add patterns to your MOD. (Noisetracker preallocates RAM enough for all 64 patterns) Audio Sculpture can be limited to take up even less RAM than those two, but as I said it's got its problems.

: |> I'm wondering if anybody has been able
: |> to use a VGA monitor with an STe to
: |> obtain the hi-res display?
: |>
: The frequency of the hi-res display of an ST is different to VGA. I think that
: the horizontal scan rate for hi-res is 31kHz whereas VGA is around 36kHz (I
: think ??). There are details of connecting a multi-sync monitor on the atari
: archive (umich or one of its mirrors). You may be able to find a second-hand
: mono-monitor for about 70 UK pounds but they tend to be fairly scarce and so
: hold their price well.

Does someone know the actual horizontal and vertical scan rates for the Atari
high res monitor as I have a VGA mono monitor at home that has a vertical rate
of 60-70Hz and a horizontal one of 31.467kHz which would probably work if the
above information is correct. I would dearly love to let my SM124 go into
retirement as it loses sync totally every so often but it is cured by a reboot.
Thanks
Dave

762. Memory inside my Falcon.

Newsgroup: comp.sys.atari.st
Date: 1996-01-13 00:00:00 UTC
From: simon@bassland.anglianet.co.uk
Message-ID: <821501988snz@bassland.anglianet.co.uk>
Source record: 152960

After looking inside my Falcon earlier, I spotted what looked like a
SIMM card! (Shock - Horror). Anyway, I thought that Falcons' had
their own 'Atari' memory board?

If it is a SIMM, there is only one slot! It would be a 4MB card,
and there were 9 chips on it.

FYI, the mystery card card was just behind the fan.

So if it is a SIMM card, can I put a 16MB, 30pin card in? To upgrade
from my tiny 4MB's?

Thankyou,

Simon.

Yep the aptly named Splitter 2 should do the job it can split nad join on both
the PC and ST side ou should be able to download it from most atari archives but
if you can not find it then I think it should be small enough to mail to you.

The program is called Ghostlink which does exactly this, however I believe it is
shareware and un-registered it will only transfer one way agin this should be
available from most atari ftp sites.

Message-ID: <4d9289$d87@backup.netppl.fi>
Source record: 152966

Hi all!

I have some big Atari ST files in PC harddisk (over 800k). I can format big disks with ST disk tool programs but MS-DOS is not able to write to these disks. Any suggestions how to get MS-DOS to write these non-MSDOS compatible disks? Is there a program for MS-DOS which does the job or do I have to split the file in two smaller pieces and then join them with my ST? I can easily split them with my PC but how do I join them with my ST? Can you recommend any freeware/shareware program which does the job?

I have also a null-modem cable and I wonder if I can transfer files between ST and PC without using a terminal program? Is there a driver that enables the ST to use the RS-port as a "virtual floppy drive" like Interlink does on MS-DOS? Of course the PC would also need a program for that but does anybody know if there is such a program (for example, Interlink for ST). Please write if you know anything helpful! If my questions are "FAQ stuff", then please inform me how to get the FAQ. Anyway, I would like to see any FAQ for Atari / this newsgroup.

Thanks in advance,
Harri

>to so I can simply save it to disk?
>
>I've noticed that I can have cab hand files to other programs based on
>file extensions...is there one that will just write it to disk?

I've been meaning to do something about this myself so I did. I've written a (Gem) program that you can install as an external viewer which CAB executes after downloading. Cab passes it the filename and all it does is ask you if you want to copy or move the file somewhere else. This has the added advantage of not losing important stuff somewhere in the cache.

Just email me if you want a copy. In fact, if anyone else wants a copy then just let me know.

I've also written something which will keep track of STiK connection times, provided you have CoSTa which can be obtained from Gary Priest (gary@the-gap.demon.co.uk).

Message-ID: <4d7eec$8bn@huron.eel.ufl.edu>
Source record: 152973

Someone asked:
1. Where can I get software for it?

Toad computers and internet

2. Can I get software on the Internet?
yes! try umich.edu or cnam.fr

3. How can I get software into it?
yes! just put the floppy with the software in it, turn on the computer and double click on any file that ends on PRG or APP.

4. Is a floppy disk that is formatted for the PC, with software on it,

Well, it will read IBM disks, but it is better if you order a manual for it so that you can learn how to use the thing. It is very easy, much easier than IBM computers. Similar to the MAC.

5. Should I used this thing as a paperweight and forget it?

No way. You can run with just one meg and a floppy great professional programs like C-Lab Notator sequencer with realtime automated music notation and many other great programs.

Please respond via email to swett@interramp.com

I did!. I hope this helps.

Thanks!

Raymond

776. Re: ST as X-term?

Hi

> first, a stock 520STfm I bought in 1986, is still with me. It's kind
> of a shame to replace it before its tenth birthday, but hey, it
> happens.

I still have my STM I bought in 1986. Still works - though I've also had
a MSTE and now a TT.

> 720K floppy), if everything works out, would be as an X windows
> terminal. I'll be using a nearby Linux box as an X server.

Should work - though you'll be pushed for memory - and you will need to
do the simple serial line mod to get the connection speed over 19200baud.

> So, I was wondering if any of y'all had any experience in doing such
> a thing. From the messages here and what little I could find on the

I have a similar setup running. I use a TT - but the same software works
on my STM (don't have the MSTE anymore). The STM only has 2.5Mb RAM so I've
not tried running the X server on it.

> Also, would it be possible to boot from a floppy and mount a Minix
> partition from said nearby Linux box to use as storage?

This *should* work - though I've not managed it. I've had the Linux/pc
machine mount Minix partitions from the TT though.

Anyway - I wrote a quick guide to all this some time ago - so I'm appending
it to the end of this email. Hope it helps. Its a little out of date - but
is essentially correct.

If you have any questions about it - please ask!

:-)

Roland.

@CiX

HOWTO set up the basics of MiNT-Net

very rough guide v0.1

This is hacked together from emails I have sent/received - and also the notes
I've made whilst installing MiNT-Net 0.7

I had the honour of 'writing' the very first MiNT-Net FAQ. However
I'm not sure why Kay still includes it as it is badly out of date, and anyway

when I wrote it I had had almost zero success with MiNT-Net!

This one decribes the most basic setup. Its *not* enough to connect your Atari to the 'net, but *is* enough to run X-windows and network to another Atari (or in my case a PC running Lunix), and allow various basic commands to work:

ping
rlogin
etc

It also allows me to run X client programs on my PC, whilst using the Atari as the X server (so that the input/output is done at the Atari end) and visa versa.

MiNT-NFS works pretty well over the top of all this also (though I've only checked it on MiNT-Net 0.6 so far).

Things you need.

A working MiNT setup with a MINIXFS partition and a shell and shell utitities (like ksh or tcsh). This in itself takes time to set up - but honestly MiNT-Ne t is a waste of time unless you can get this far.

The MiNT-Net 0.7 .gz file and tools to unpack it (gzip and tar).

Make sure everything is run off the u: drive. This gives a universal Unix like

structure with one central root. Normally under u: only the physical partitions appear (and a load of system directories) but you can set up extra links in the mint.cnf:

```
sln d:\etc u:\etc
sln d:\bin u:\bin
sln d:\usr u:\usr
sln d:\user u:\user
sln d:\tmp u:\tmp
```

In this case my drive d: is my MINIXFS partition.

Unpack the MiNT-Net archive onto d: somewhere. I did:

gzip -d <name>.gz

mv <output> mn07.tar

tar xvf mn07.tar

I think it is better if both gzip and tar themselves are on a MINIXFS partition - as this seems to preserve long filenames/case better.

Assuming net-070 is the 'root' of the unpacked files:

copy everything in net-070/etc to /etc
copy all binaries in net-070/tool to /etc

In the above 2, its very important that case is preserved - and that execute permisions are on the the binary files.

copy net-070/net/sockdev.xdd to c:\multitos
copy net-070/net/drivers/slip.xif to c:\multitos

Then reboot - and run the the 'connect' script. This should startup a slip connection to whatever is connected to serial2.

As for the config files in /etc - this is what I have set up. Note all IP addresses are fictional as my setup is not connected to the 'net.

HOSTNAME:
tt

HOSTS:
```
#
# /etc/hosts -- Host database for Mint-Net (w) 1994, Kay Roemer.
#
# The form for each entry is:
# <internet address> <official hostname> <aliases>
#
127.0.0.1 localhost loopback
100.0.0.1 tt
100.0.0.2 stm
100.0.0.3 pc
```

RESOLVE.CONF:
```
domain rack.co.uk
nameserver 127.0.0.1
```

CONNECT shell script:
```
stty 19200 < /dev/aux
u:/etc/ifconfig lo0 addr 127.0.0.1 up
u:/etc/slattach -p cslip -t /dev/aux -r 100.0.0.3 -l 100.0.0.1 mtu 2000 &
u:/etc/route
```

CONNECT is one I've written. It sets up a hard connection between 100.0.0.1 and 100.0.0.3 via the serial2 port. I explicitly set the 'mtu' and 'cslip' to make sure they are the same as the PC end.

The first command 'stty' is not part of the MiNT-Net distribution - but is very useful for setting the serial port speed. I can uploaded it if needed.

<actually slattach now takes a '-s' option which can be used to set the serial speed IIRC>

Anyway thats about it. This is by no means a complete or even nearly 100% correct way of doing things - but I hope it might give people a few pointers.

The next SwapMeet is Monday, February 5th, 1996.

WANTED: Dealers to sell at Upcoming Swap Meets. Dealerships sought fall into such Categories as Computer Dealers, all kinds. All kinds of Computer HardWare, SoftWare, Peripherals & Accessories for ALL Computer Makes and Types.

Also Sought are Dealers in Video Gaming Equipment, such as Video Game Consoles, Cartidges, Video Game CD Players and Video Game CDs. ALL Video Game Makes and Types. ALL Video Game Consoles, Cartridges, CDs, Peripherals & Accessories.

At Februarys SwapMeet do we have a SweetHeart of a deal for you! A Hewlett Packard Deskjet Printer offered as a Door Prize! Any one can win, just show up for the drawing!

Recruiting New Dealers with Membership for Dealer Value. You could setup at a full year of swapmeets, 12 Monthly swapmeets at $10 a Meet, for $120 a year, or join our group and setup ***FREE*** for a year for ONLY $50! Greater than a 50% Savings!

Also Wanted are Dealers in ALL Types of Electronics.

WANTED are Dealers in Ham Radio, CB Radio, Music CDs and other Recorded Music. Stereo Equipment also Wanted.

Also Wanted are VCR's, Video Tapes, TVs and Satelite Gear.

This is an ALL Computers, Game Machine and Electronics Swap Meet!!

Small Businesses, and Dealers Welcome and Wanted!!

NO ADMISSION CHARGE!!! PLENTY OF FREE PARKING!!! NO ADMISSION CHARGE!!!

TABLES $10! TABLES, FIRST COME, FIRST SERVE!

Swap Meet Location in Portland, Oregon. USA. At 1819 N.W. Everett St. at the NorthWest Service Center On the First Monday of each Month.

To find out about more about the Swap Meet call our 24 Hour Recorded info line at (503)650-7196 or for Live info, call from 3 PM - Midnight, Monday - Thursday, Friday 3 PM - 6 PM. Please call, especially dealers at: (503)256-9974 (VOICE/VOICE MESSAGING), leave your home number if Ben is not answering!

Reply in E-Mail to bensmith@teleport.com. Or Call Ben Anytime at

On 9 Jan 1996 13:03:29 GMT ,Twas none other than Renaud Hacquin who did state ....

> I have a falcon with an Afterburner and I'd like to install linux. But
> bootstrap.ttp doesn't work. Firstly it believe my falcon to be a Medusa and
> secondly, it stops after writing "Booting Linux..."
> Can anybody help me ?

Try asking the same in comp.os.linux.m68k ,which is where all the atari linux
folks hang out .

Sorry to here this , hope it is fixable as I am eyeing up the 040 for my linux
system.

If it doesn't work and people ask ,bug report I am sure it WILL be fixed.

PS what kernel and is it a system that worked with 030 standard before ?

afn14016@freenet.ufl.edu spake thusly:

A > For businesses, yes get and XXX computer but music my friend I

For businesses, *no*! At least not home businesses. If you haven't heard horror stories about people who buy XXX computers (klones) for business and never get anything accomplished with them, you simply haven't been listening. I was told there was a survey done that found that 20-30% of all pc purchases ended up with something broken (like a cfg.sys file), and the unit put on a shelf and abandoned. At $1000 minimum, that's a lot of wasted money (and silicon).

bjr@EbiCom.net (Brian Roland) inquired:

BR> is there a good mail reader/writer for the atari that works
BR> under GEM?

I don't know whether this is quite what you are asking, but... I used Microtalk qwk reader (MT_READ.xxx?) for a short time before changing to Mountain. Check it out - I liked it, and it is fully GEM. I dropped it because I was having trouble with its reply packets, which turned out to be not its fault, but the pkzip2.04g problem.

Does it have to be fully GEM? - because Mountain Reader gives routine access to accessories, and works just like a GEM program. It just doesn't give you the full menu bar. Demo version available.

:
: >I just purchased HP DeskJet 660 Color; a fine printer, but it seems HP
: >intends to turn its customers into PC users =(...
: >>>>SNIP<<<<<
:
: Unfortuanatly so. The problem is probably due to the fact that HP
: sell most of their printers to PC+WINDOWS owning consumers. This
: would mean that if they can control _everything_ via driver it saves
: the cost of adding buttons and stuff to the printer, and so it is
: done. Obviously the removal of these buttons hasn't majorly damaged
: their sales as they continue to do it. This means for us Atari uses
: we are a minority, and unless some clever programmer out their decides
: to develop a program that can drive these printers from Atari progs
: (such as Calamus, Protext, 1st Word and all the others I use) we will
: be unable to use any advanced functions.

I've never accepted - and never will - the so-called "commercial realism",
which means pleasing the majorities - and the majorities only. That may
bring money to some firms more than decent customer service, but is it
right anyway..? Hardly. I can't understand anyone who supports this
kind of cold, inhuman business. But as this is the way things are, we
- as you say - have to put our hopes on individual, clever programmers.
Some of those might even sell his/hers "HP Control Panel for Atari" to
Hewlett Packard. HP could well afford it - and we would have fewer
problems after this...

Yes, HP could afford supporting us. I just wonder, whether anyone in
computer business just _cares_ about anything anymore..?

: The question this leaves is: is there any programmer out there with
: time to spare who fancys solving this problem, writing possibly a
: universal printer driver which can print to these new printers ??? Or
: just to take the time to develop printer drivers for the most common
: progs ?

There are many, I believe. The French guy who wrote the CPX-module for
HP 660C I mentioned in my previous message, could well improve the
module into perfection - and that would be the solution for us all.

It's great there still are those kinds of people around!

Tommi

>looks at the first address, and then executes the code it points to.
>Am I on the right lines here ???

Yep.

Vector number 1 ($004) is the reset handler (address). Write your
handler address here.

>The reason I ask is because I want to write a program that surpresses
>a reset, and continues the program, so that a resolution change for
>instance is possible (from low to high or vice versa). If this
>doesn't work then I may produce a little warning message for others
>who use my computer, so that they don't reset programs without saving
>their data.

There is no need to intercept the reset vector for a resolution
change - intercept the monitor detect routine instead. By default this
points to the reset handler. This is at vector number 79 ($13C),
interrupt 7.

>I'm not really interested in how to program the suggestions so much as
>how to change the reset vector and use my own code, and how limited
>the vector is. The programming is my challenge !!!!

The machine is going to be in a pretty confused state. You will have
to set it up from *scratch*.

I've never done any of the above. I hope I'm wrong and it's easy :-)

If its like the TT - then the PSU is very PC like. I just used a PC-XT 150W PSU to power my TT from. It doesn't fit in the case - but the plugs fitted the TT's motherboard with very little modification.

Obviously make very sure all the wiring is correct before powering on. Not all PC PSU's are wired the same!

I've just tried getting the address dynamically with Demon. It might
have worked. I commented out the "ip addr" line. An initial "ppp sl0"
revealed my local IP address as 0.

I then logged on and a quick "ppp sl0" still revealed it as 0 then
another a few seconds after. Lo and behold the address had been filled
in correctly.

It may be that there was some other reason for it working, but give it
a try and please let me know if it works.

I took a peek at the source code - typing "ip addr [xxx.xxx.xxx.xxx]"
manually after being given the address may stand a chance of working,
then again it might not! :-)

794. Printer Drivers... Compilation needed!?

Newsgroup: comp.sys.atari.st
Date: 1996-01-13 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DL55tq.Gup@actrix.gen.nz>
Source record: 152992

I've noticed a lot of requests lately for various printer drivers, and after looking around most of the sites, have come up with very few that are actually easy to find. I had a disk with quite a few GDOS printer drivers, but much to my annoyance, the disk was corrupted.

I am after drivers for a Star-LC10II Colour printer (or compatible), and for an HP-Deskjet 400 (Colour and/or monochrome). I haven't looked for the HP drivers yet, but as these things are now quite cheap (About $250), I'm looking at getting one to replace my old 9-pin.

Is there anyone out there (Danny?) who is willing to compile on a site or something, a collection of any printer-drivers that can be located for the ST? I have no problem looking for them and sending them, but I have no way of making them available to everyone else. I'd imagine people with the Compilation-CD's (Crawly Crypt etc.) could help with this cause.

Anyone out there who wants to act as curator? (Maybe a more obvious "Printer" area on Hensa!? (which IMHO is one of the nicer Atari software sites, built-in search engine saves a lot of hassle!))

This is a recurring problem, as it's a real pain searching dozens of sites for a printer driver, as they are one of those things that may not be of use to many people, but when you need it, it'd be a lot nicer to know where to look!)

I've looked on, micros.hensa.ac.uk, ftp.cnam.fr, ftp.cs.tu-berlin.de, ftp.uni-kl.de, atari.archive.umich.edu, ftp.???.fi (forgotten the name), and none have a great deal of drivers. I'd say the majority of useful drivers would have to be in GDOS form.

If they're in foreign languages, (French & German anyway), then I usually seem to able to translate them pretty well (IMHO I did a pretty good job with the _excellent_ viewer utility "Guck").

So, what do people think?

For quick writing Steno is very nice, though there are also a
number of public domain programs out there. Papyrus is the best full
featured writing program if you have a monochrome monitor or the higher
resolutions of a Falcon. Henry L Lazarus hlazar@netaxs.com

TOAD COMPUTERS ATARI BLITZ CONTINUES! ---- DECEMBER 14, 1995!!
==========

Toad Computers is happy to bring you even more news about exciting new products and developments that will affect YOU as an Atari owner!! Find out about hot news like the new $99 price on the JAGUAR!!!!

Toad News:
- TOAD HOLIDAY FESTIVAL IS A SUCCESS!
- NEW TOAD CATALOG NOW AVAILABLE!

Hardware:
- C-LAB ANNOUNCES NEW FALCON MK-X!
- ATARI JAGUAR NOW JUST $99!!
- JAGUAR CD ROM AND GAMES NOW IN GOOD SUPPLY!
- BlowUp FX FALCON EXPANSION BOARD IS NOW AVAILABLE!
- BlowUp FALCON SCREEN EXPANDERS IN STOCK!
- DOUBLE-SPEED CD ROM DRIVE --- CHEAP!!
- TT030 SPECIALS
- 1040STE SPECIALS
- ATARI MEGA STE FOR JUST $299!
- HARDWARE, GAME, AND SOFTWARE CLEARANCE!
- SOUNDPOOL INTERFACES IN STOCK!
- SPECIALS ON FLATBED SCANNERS & GT LOOK SOFTWARE!
- PAK 68/3 ACCELERATOR & FASTRAM BOARDS!
- TOAD HIGH SPEED SERIAL PORT KIT!
- TOAD HIGH DENSITY FLOPPY DRIVE KIT!
- DESKTOPPER ALTERNATIVE ST/FALCON CASE!
- SYQUEST EZ-135 IS A SMASHING SUCCESS!

Software:
- PAGESTREAM 2.2 AVAILABLE FOR JUST $39.95!
- EASE 4, MAGIC 4 NEWS!
- "HD DRIVER" SUPPORTS ZIP DRIVES & MORE!
- WHITELINE DELTA CD NOW AVAILABLE!
- NEW ATARI COMPENDIUM CD-ROM ANNOUNCED!
- NEW CD's FROM SYSTEMS FOR TOMORROW & CRAWLY CRYPT!
- SUZY B SOFTWARE TREASURY CD SET NOW JUST $49.95!
- MagiCMac v1.2.5 & NEW MANUAL MAILED FREE TO ALL REGISTERED OWNERS!
- APEX MEDIA & EXPOSE PROVE TO BE HOT ITEMS!
- DIGITAL ARTS PRODUCTS ARE _HOT_!
- STRAIGHT FAX 2.5 UPGRADE AVAILABLE

Strap on your zero-gravity helmet and let's get going!!!

TOAD HOLIDAY FESTIVAL

Toad Computers Holiday Festival '95 was a great success once again and we thank everyone who came to show support - both developers and customers!!! Developers / Exhibitors Included:

- Dan Wilga, Gribnif Software Northampton, MA
- Darek Mihocka, Branch Always Software Seattle, WA
- Rob Perry, System Solutions London, UK
- Tom Harker, ICD / Black Cat Designs Rockford, IL
- Kent Kordes, Systems For Tomorrow Independence, MO
- Steve Cohen, Wizztronics Jefferson Sta., NY
- Greg Ondo, Steinberg Jones Woodbridge, VA
- Matt Norcross, Floating Fish Studios Pottstown, PA
- Ben Aein, Formula 1 Rockville, MD
- Ken Fassler & Betty Burchell, NOVATARI Bethesda, MD

Every year, Toad Computers sponsors a holiday raffle at our show to benefit HABITAT FOR HUMANITY. Atari generously donated three Jaguars, and three games (Ruiner Pinball, Pitfall, and Super Burnout)! And we donated a Jaguar CD Unit! Winners were drawn at the end of the show on Sunday. They were:

Jaguar + Game of Choice Wes Pinter
Maurice Rdesinski
Bruce Evry

Jaguar CD Gino Razionale

Ironically, Gino Razionale won our grand prize last year of a Jaguar + Alien vs. Predator! Now he has a JagCD to use with it!!! Gino has been a longtime Toad customer and loves his Jaguar! Congratulations Gino and to everyone who helped make the raffle a success! We will once again be donating nearly $500 to our local Habitat for Humanity chapter!

Another customer, Fred Pierce, is preparing a piece for ST INFORMER that will tell you about all the great stuff displayed at Toad Holiday Festival. Watch for that issue in 4-6 weeks! In the meantime, if you want to see pictures that were taken and posted to the Internet, go to http://www.toad.net/atari/news/holifest.html!!

Anyway, the show was a great success, business was certainly brisk, we're just about recovered from the strenuous pace of that weekend, and we want to thank everyone who helped make it the event that it was! Special thanks to Rob Perry of System Solutions (and the whole gang there) who came all the way from London to demonstrate some of the hottest new products available for Atari Computers!!! THANKS AGAIN!

NEW TOAD CATALOG NOW AVAILABLE

We now have an ALL-NEW 56 page catalog available! For the past three months, DAVID TROY and TODD LOVE have been hard at work on an entirely new catalog. The Catalog features products for the Atari Lynx, Jaguar, ST, Falcon, TT, Stacy, STE, and PC-Compatibles. All new photographs and artwork make the catalog the best one ever! David Troy explains, "We're really excited about the changes we've made and the new products we've been able to feature."

The new catalog is being mailed this week and should be reaching homes between December 4 and 18. If you are not on the Toad mailing list and would like to receive a catalog, please send email to info@toad.net or visit our web page at http://www.toad.net/.

The catalog includes detailed information on items such as MagiCMac, Kobold, NVDI, EASE 4, MagiC 4, and much, much more! The catalog has also been ported to the World-Wide-Web in both HTML and ADOBE ACROBAT PDF formats. Check http://www.toad.net/atari/ for the latest progress!

One quick note: as we said, the catalog is available in PDF format -- this is Adobe's Acrobat format. In order to read this format, you will need Adobe's Acrobat reader, available for Mac & PC and some UNIX platforms. HOWEVER (there's always a 'however,' isn't there?) the PDF files can also be parsed by the latest version of GhostScript (a public domain PostScript interpreter made available free under the Gnu Public Software License) on the Atari. GhostScript is available for download on Genie or on Toad Computers UMICH ftp mirror site (ftp.toad.net/pub/umich). You can also buy GhostScript on the new WHITELINE Delta CD ROM ($45, see below!!) Anyway, Adobe's ACROBAT format is a great way to distribute printed documents electronically, and reading PDF files with GHOSTSCRIPT does work!!

==========
ToadNet! http://www.toad.net/ info@toad.net ftp://ftp.toad.net/
==========

C-LAB FALCON MK-X ANNOUNCED!!

C-Lab of Germany announced the new Falcon MK-X at the ProTOS show held in Bonn on November 25 & 26. The Falcon MK-X is the same basic Falcon MK-I/II to which we have become accustomed, but in a new, sleek and expandable case.

Based on the successful FALCON MK-I specification and complete with the audio quality improvements which distinguish C-LAB's machines from the Atari original, C-LAB's latest machine is supplied in a new attractive desktop housing which gives plenty of room for various important internal expansion options. The MK X (signifying eXpandability) is controlled using a PC-AT style keyboard and Atari-

compatible mouse.

The MK X features the same basic connectivity as a standard FALCON with the exception of the stereo mini-jacks for audio in and out which have each been replaced by two standard size mono jack sockets. This gives a better connection for the professional musician, as well as compatibilty with standard audio patch cables. The price for the MK-X machines has not yet been announced, but it will be only a bit higher than comparable MK-I/MK-II machines. Falcon MK-X machines will begin shipping sometime in January 1996.

INTERNAL DRIVE OPTIONS

The MK X can be purchased with an optional internal SCSI bus (like the MK II) which can accommodate various 3.5" hard drives (up to 4GB), or alternatively a SyQuest removable drive. Different aluminum blanking plates can be fitted to the front panel depending on the chosen media.

DIGITAL INTERFACE OPTION

Along with the existing RAM and hard disk options, an optional internal digital (DAT SPDIF) interface is available. Pricing has not yet been announced. All Falcons (Atari, MK-I/II/X) are compatible with external SPDIF interfaces from SoundPool and BlowUp.

UPGRADING TO MK-X

C-LAB Falcon MK-I/II owners can upgrade their computer to the MK X configuration for just the cost of the new case. This is handled directly by Toad Computers. This recasing might be a good time to add other hardware upgrades like RAM, hard disks, or digital interface as well.

Atari FALCON030 owners can also take advantage of this upgrade, depending on the exact model of their motherboard. The C-LAB audio modifications would be a necessary part of this upgrade. Prices for this upgrade will be made available soon.

WHAT DOES IT LOOK LIKE?

Pictures of the new case are available on our web site at http://www.toad.net/atari/c-lab, the new Official C-Lab Falcon Home Page. We have also uploaded these pictures to Genie (TOADMKX.ZIP). The new case design is sleek and supports many of the expansions Falcon owners want most -- including the new BlowUP FX Board!! Keep reading!!

CHRISTMAS SPECIAL -- SAVE $200 ON THE FALCON MK-II!!

The Falcon MK II -- the top of the line in the C-Lab series -- started out at $2495 for a machine with these features. Now, thanks to the success of the product and economies of scale, you can take advantage of this HOT NEW PRICE -- for a limited time!

Falcon MK II, 4MB RAM, 530MB SCSI Internal 2.5" HD.....$1299.00

Great Package Deals!
Cubase Audio 16 (Bundled with any C-Lab Falcon) ....Add $399.00
14MB Upgrade (from a 4MB machine).....Add $599.00
SCSI / IDE Internal / External Hard Disk Options.....Call!
Math Coprocessor (68882, Installed).....$59.00
Monitor Adapters (Choose VGA or ST RGB).....$14.95

C-LAB FALCON FAST FACTS:

* Imported by Toad Computers
* In Stock Now
* Same case as Atari Falcon030
* Other Hard Disk Sizes Available, Please Ask
* All plugs & ports identical to Atari Falcon030
* Falcon MK-II has internal SCSI bus for 2.5" SCSI Drive
* Includes 1 Year Warranty Through Toad & C-LAB

For more information on the C-LAB Falcon or any product we sell,
please call Toad Computers at (410) 544-6943.

ATARI JAGUAR NOW JUST $99!! UNBELIEVABLE NEW PRICE!!

December 14, 1995 -- SUNNYVALE, CA -- Atari Corp. today announced dramatic price reductions on its Atari Jaguar 64 video game system. The system is now priced at just $99 and mass merchants everywhere are excited about the change. The system had been priced at $149. Now more than ever, the 64-bit technology of the Jaguar is accessible to buyers everywhere.

Atari believes the new price will lead to major acceptance of the platform in the marketplace, and provide an even stronger base for its expanding library of games and the JagCD peripheral unit.

Tom Harker, president of Black Cat Design (manufacturers of the Catbox and developers of the Jaguar game Battle Sphere) had this to say, "This is truly wonderful news. Atari needs to be competing with the Super NES and Genesis, not with the Playstation and Saturn - and at this new price point, they can."

The Jaguar 64 now has a library of over 40 games and is the world's first 64-bit video game system. The Jaguar 64 CD-ROM peripheral is $149 and includes Blue Lightning, VidGrid, and VLM -- the Virtual Light Machine.

The Jaguar 64 and CD-ROM peripheral and new games like Missile Command 3D and Dragon's Lair are available directly from mail-order merchants like Toad Computers. Order yours _toaday_!

==========

BLOW-UP FX BOARD -- THE AMAZING THREE-IN-ONE FALCON EXPANDER!

Toad Computers is pleased to announce the availability of the BlowUp Falcon FX Board. This dynamic expansion board for the Atari/C-Lab Falcon 030 provides acceleration and expansion that's unparalleled by previous boards. The board is just $249 and will begin shipping by the end of December, 1995.

BLOWUP FX: FAST-RAM, ACCELERATOR, RESOLUTION-EXPANSION

BlowUp FX includes three major enhancements for your Falcon030. We will explain each segment of the board and how it can enhance your system:

FAST-RAM

Upgrade your Falcon to up to 32MB of RAM. Aimed primarily at 4MB Falcons, this board gives you four 30 pin SIMM sockets into which you can install 1MB or 4MB 30 pin SIMMs. This is a great way to recycle those old 30 pin SIMMs!

The RAM installed in the BlowUp FX board is FAST RAM -- meaning it is not used for video functions. The FastRAM comes after the standard Falcon RAM in memory -- meaning that your 4MB of Falcon RAM can still be used! So, you can take your Falcon to 14MB by adding the FX board and 2 (each) 1MB and 4MB SIMMS -- 4 + 2 + 8 equals 14MB, and this is FASTER RAM than you get with a standard 14MB machine!!

The new FAST-RAM can be used for all functions, including DMA access, but is not used for video. Because there is no video access to the FASTRAM, it is up to 50% faster than conventional Falcon RAM in color modes.

The FAST-RAM can be used with accelerators you may have previously installed, like the PowerUP 2, or you can install (enable) the accelerator included in the FX board. If you use the included clock accelerator, a special Page-mode of RAM accessing will be used in 32/36/40MHz modes. This allows RAM-access with no waitstates and increases the memory throughput from its regular 8MB/second to a whopping 20MB/sec!! If you don't need the acceleration functions, the FX is still a simple 'Plug-N-Play' memory card.

If more than 10MB is inserted into the FX, the upper part is switched by the MMU and the FX-logic chips. The management of the extended memory is done fully invisibly for all applications by using the PMMU built-in to the 68030 CPU.

To achieve the full 32MB of the board, you will need a second RAM daughterboard (coming soon). This board has an additional four 30-pin SIMM sockets and can accommodate 16 more megabytes of RAM. This daughterboard will not fit in a standard Atari/MK-I/II case and would require something like the C-Lab Falcon MK-X case.

CPU & SYSTEM CLOCK ACCELERATOR

Take your Falcon to new speeds with the clock accelerator included on the BlowUP FX board. Choose between a 32MHz, 36MHz, or 40MHz system clock. This results in CPU speeds of 16MHz (normal), 18MHz, or 20MHz. With the special logic chips included on the FX, nearly all Falcons can use a 40MHz system clock. The clock may be switched on booting or during operation using a CPX module. Soldering is required for installation, and we recommend you have us do it for you.

DSP ACCELERATOR

Increase the speed of your Motorola 56001 Digital Signal Processor chip from 32MHz to 50MHz! Superb for MPEG decoder software and other DSP-intensive applications! Installation requires soldering.

BLOWUP HARD-I

The well known and time-tested resolution expansion also found a place on the FX card! With great control software and super resolutions of 800 x 608 @ 84 Hz, 1024 x 768 @ 104Hz. Installation requires soldering.

That's right -- all of these great new features are incorporated right into the FX Board -- everything from FASTRAM to the CPU ACCELERATOR, the DSP ACCELERATOR and HARD-I RESOLUTION EXPANDER, all on one handy board!!!

TECHNICAL DATA:

* SIZE 160MM X 65 MM -- plugs into expansion slot
* 4 SIMM sockets for 1MB x 8/9 or 4MB x 8/9 SIMMS (min 70ns) (with FIRMWARE UPDATES, 16MB 30 pin SIMMS can be used too!)
* 4 additional SIMM sockets on optional daughter board (soon!)
* 200mA power consumption when loaded with 4 SIMMS
* Flash-ROM updatable through software, so new features and enhancements will not require a new ROM or hardware changes
* Expansion Port is Daisychained: Compatible with Falcon Speed!!

BLOWUP FX FAST FACTS:

* Imported by Toad Computers
* Available 12/31/95

* Works in Atari & C-Lab Falcons
* CPU Acceleration Also Accelerates 68881/2 FPU Chip
* Includes FASTRAM, CPU & DSP Acceleration, Resolution Enhancement

BlowUp Falcon FX Board.....$249.00
4MB 30 Pin SIMMS.....$149.00
1MB 30 Pin SIMMS.....$ 39.00
Installation (of CPU Accelerator or Hard-I Sections).....$ 79.00

Also In Stock are BlowUp's Falcon Screen Expanders, and BlowUp's NEW PSI Pocket SPDIF DAT Interface.

BlowUp Software.....$ 19.95
BlowUp HARD-I.....$ 69.00
BlowUp HARD-II.....$ 99.00
BlowUp PSI SPDIF INTERFACE.....$299.00

SOUNDPOOL INTERFACES AVAILABLE AGAIN!!

Toad Computers is pleased to announce the availability of the
Soundpool line of Falcon hardware interfaces & music software.
Previously these interfaces have been sold in conjunction with other
music software packages; now they are available through Toad Computers
direct!

Specifically, we have:

Falcon S/PDIF DAT Interface (Plugs in DSP Port to provide a fiberoptic
interface to a DAT drive).....$299

Falcon Analog 8 Interface (Provides 8 analog ouputs for the Falcon,
plugs into the DSP Port).....$549

Falcon Analog 4 Interface NEW! (Provides just 4 analog outputs for the
Falcon, plugs into the DSP Port).....$299

MO-4 (Adds 4 MIDI out ports to any Atari or PC computer! Excellently
suited for use with the Atari Falcon030).....$199

Sample Rate Converter (Converts S/PDIF digital audio data freely
between 32KHz, 44.1KHz, and 48KHz ON THE FLY! Great for mastering to
44.1KHz for CD Production from the Falcon).....$399

Also available are CD RECORDER Audio and CD RECORDER Pro software,
AudioTracker software, and AudioMaster software.

FLATBED SCANNERS: GREAT DEALS FOR YOUR ATARI FROM TOAD!!

Toad Computers is the official distributor for DIGITAL ARTS' GT-LOOK Scanning program for the Atari. This allows you to use your Atari to scan high quality images using EPSON flatbed color scanners.

The Epson ES-1000C and 1200C are flatbed color scanners that produce spectacular results with your Atari, Mac, or PC. Simply connect it to your machine and you're ready to start scanning high quality images for use in desktop publishing, multimedia presentations and even games! On an Atari, you'll need to be using the GT-Look program.

It allows your Atari to communicate with the Epson scanner by way of either a special MIDI and parallel cable, or through SCSI on a TT or Falcon. It's easy to use! The 1000C is capable of scanning images at 1600 dpi interpolated with a color depth of 24 bit (16.7 million colors). The 1200C is capable of scanning at 2400 dpi interpolated with a color depth of 30 bit (10 bits per pixel, converted to 8 bits per pixel), providing better shadow detail rendering. Then you can start scanning high quality images - in either true color, grayscale, or line art modes at resolutions of 50 through 2400 dpi. Color scans are single pass, so registration is always accurate. Saves as TIFF and TGA format graphics. Imports easily into Pagestream and Calamus SL.

Epson Scanner 1000C Text Enhancement Technology with up to 1600 dpi scanning resolution and 30-bit pixel depth for reading over one billion colors will give users of the ES-1000C everything necessary to get the best image quality possible. The scanner comes with SCSI and bi-directional ports for dual connections to a Macintosh and PC at the same time.

ES-1000C

Features
Page Size: 8.5x11.67"
Horizontal: 400 dpi
Vertical: 800 dpi
Resolution: 1600 dpi
Image Data: 24 bit
Speed: 60 seconds
Zoom: 50% to 200%
Brightness: Adjustable
Lamp: Noble Gas Flourescent
Width: 14.5"
Depth: 22.5"
Height: 6.5"
Weight: 26 lbs.
Warranty: 1 Year

Epson Scanner 1000C 800 dpi flatbed scanner.....$ 799.00
With GT-Look Software.....$ 948.00

Epson Scanner 1200C

Mid range to professional graphic artists can take image processing to new heights. With the award winning ES-1200C, you get the highest

resolution to catch the fine detail in larger images or to magnify the small images while maintaining clarity. Full-color, gray scale or black and white images are scanned right the first time with EPSON's TruePass Technology. Best of all, you can also opt to scan in one or three pass.

Features
Page Size: 8.5x11.67"
Horizontal: 600 dpi
Vertical: 600 dpi
Resolution: 2400 dpi
Image Data: 30 bit
Speed: 16 seconds
Zoom: 50% to 200%
Brightness: Adjustable
Lamp: Noble Gas Flourescent
Width: 14.5"
Depth: 22.5"
Height: 6.5"
Weight: 26 lbs.
Warranty: 1 Year

Epson Scanner 1200C 1200 dpi Flatbed Scanner.....$ 999.00
With GT-Look Software.....$1148.00

===== AS IF THESE AREN'T EXCITING ENOUGH.....

Epson ACTIONSCANNING II System -- LOW COST SCANNER!

The Action Scanning System II from Epson is the perfect way to bring pictures, drawings and documents into your computer. Even if you've never used a scanner before, the Action Scanning System II makes scanning quick and easy. It comes with a complete package of software to help you scan and work with color, grayscale or black and white images, as well as convert text documents into files you can edit. In addition, it lets you make copies using your color or grayscale printer. All of this is done with automatic software control to set resolution and adjust color for maximum quality and speed. It doesn't get any easier than this.

General Specifications
Scanner type Flatbed color image scanner
Sub-scanning method Movement of the reading head
Photoelectric device CCD line sensor
Maximum read area 8.5" x 11.7"
Effective pixels 2550 x 3510 (300 dpi)

Scanning Specifications
Optical resolution 300 dpi x 600 dpi
Max resolution 2400 dpi x 2400 dpi
Main scan 300 dpi
Sub scan 300 dpi
Output resolution 50 x 1200 dpi (1 dpi step)

Image data
Color separation By the light source (G,R,B)
Gray Scale 8 bits/pixel
Zoom 50% to 200% by 1% step
Light source Noble gas fluorescent
Brightness 7 levels

Scanning speed
Line-art 3 msec/line
256 Grey 3 msec/line
Color (line/byte seq) 11.5 msec/line

Digital Halftoning
Bi-level Error Diffusion 3 mode (A, B, C)
Dither 4 modes, User specified dither
2 modes
Quad Level Error Diffusion 3 mode (A, B, C)
Dither 4 modes, User specified dither
2 modes

Gamma Correction
CRT 2 level (A,B)
Printers 3 level (A,B,C)
User defined 1 level

Color correction
4 modes Impact-dot matrix
Thermal
Inkjet
CRT display

Interface
Interface SCSI and bi-directional parallel

Warranty
Warranty One-year limited in the US

Epson ACTIONSCANNER II.....$599.00
With GT-Look Software.....$748.00

PAK 68/3 ACCELERATOR -- TWICE AS FAST AS A TT030 FOR UNDER $500!

The PAK processor replacement card turns your Mega ST, Mega STe, STfm, or STe computer into a 32-bit system using the 68030 processor like the TT030 or Falcon030. Unlike these machines, however, the PAK uses a 32KB level 2 cache. This means that a machine with a PAK running at 32MHz runs 21% faster than a stock TT030! This is incredible speed!

Compatibility is excellent. As a guide, all programs running on the TT or Falcon will probably also run on the PAK. If you need 68000 compatibility, we can install a switch to let you switch back and forth

between the 68000 and 68030. A TT or Falcon can't do this!

How fast can the PAK go? It runs best at 32MHz, but can go up to 40 or 50MHz if you install the optional $79 buffer board. Let us know if this is something you need! An optional FASTRAM board also helps add RAM and increase speed!

PAK 68030 Board w/68030 and TOS 2.06.....$399.00
PAK 68030 Board w/68030 and PAK TOS 3.06 (faster).....$499.00
68882 FPU Chip (Optional).....$ 59.00
STE PLCC Adapter Board (for Square 68000).....$ 69.00
FASTRAM Expansion Board (up to 128MB).....$169.00
50MHz Buffer Board.....$ 79.00
Complete Installation.....$ 79.00

ToadNet! http://www.toad.net/ info@toad.net ftp://ftp.toad.net/
==========

DESKTOPPER / FREEKEYS Alternative ST/Falcon Casing!!

Take your ST or Falcon and place it into a new desktop style case. Rather than actually recasing your entire machine, the Desktopper uses the bottom half of your existing ST or Falcon case with a new top.

Freekeys lets you detach your standard Atari keyboard and use it externally. Also includes two 5.25" disk drive bays for internal mounting of hard disks, floppy drives, and more! Great for accelerators like the PAK 68/3!

Desktopper & Freekeys IN STOCK.....$199

TOAD DELIVERS SYQUEST EZ-135!

Toad Computers became famous in 1989 with its ToadFile 44, a high quality hard disk package for the Atari based around SyQuest's SQ555

44MB removable drive. That trend continues TOADAY with the new SyQuest EZ-135 135MB removable drive.

That drive has been available for the past few months and sells for just $233.95! That's right -- for less than $250 you can have a complete, removable 135MB hard disk. Faster than floptical, faster than ZIP, the EZ135 performs as a fully functional hard disk drive.

Best of all the EZ-135 comes ready to plug into an ICD Link 2 Host Adapter ($99), with two SCSI ports, so you can put it anywhere on your chain. Yes -- it has 2 50 Pin SCSI Centronics connectors, and it also provides its own termination power. Why go ZIP when you can use the power, speed and EASE of the EZ-135?

Cartridges are just $24.95. Order your EZ-135 SYQUEST drive from Toad Computers TOADAY! With an access time of just 13.5ms and a sustained transfer rate of 2.4MB per second, nothing else compares!!

PAGESTREAM 2.2 NOW AVAILABLE FOR JUST $39.95!

We've been excited about this announcement for weeks now, and we're glad now to finally be able to tell you that PAGESTREAM, one of the premier desktop publishing packages for the ST is now available for a mere $39.95! That's right! For just $39.95, you can take advantage of the flexibility and creative power that people have been enjoying for years!

WHY is PageStream just $39.95? SoftLogik is planning to release PageStream for Windows 95 and the Mac OS. As a way to help build their prospective market for that platform, they want to make sure that every available Atari owner knows the power of PAGESTREAM. This way, if an Atari user has to make a decision about whether to buy PAGESTREAM over PAGEMAKER or QUARK XPRESS, they will be familiar with PAGESTREAM already! This will give them a tremendous advantage in this new market!

For those of you who don't know about the power of PageStream (how could you not?) features of the package include:

- Uses PostScript Type One Fonts (Use .PFB and .AFM files)
- Import Adobe Illustrator Vector graphics directly
- FULLY PostScript Output Compatible
- Works with PostScript Imagesetters
- Supports Color / Color Separations
- Drivers for most black and white and color printers, including 600 dpi lasers and color inkjets
- Imports many graphic file formats including GIF, TIFF, PCX, AI
- Import and Export Text
- Group & Ungroup objects, send to back & bring to front

- Rotate, twist, or flip objects in tenth of degree increments
- Cut and paste between documents
- Open multiple documents simultaneously
- Automatic and Manual Kerning
- Object Alignment Feature
- MANY MANY OTHER FEATURES!

In short, PageStream 2.2 is a fully professional desktop publishing package that is every bit as capable as the mainstream PC / Mac equivalents (moreso in many areas).

We wish SoftLogik every possible success in their new endeavors, and we invite you to try PAGESTREAM 2.2 now! PAGESTREAM 2.2 WILL BE AVAILABLE AT TOAD HOLIDAY FESTIVAL 95!

PAGESTREAM 2.2 FOR ATARI ST/TT/FALCON030/MAGICMAC.....$39.95

EASE 4 RELEASED, MAGIC 4 COMING THIS MONTH!

EASE 4: The Hottest Desktop Available!

As another great component in the MagiC/NVDI/Kobold family, EASE provides the desktop to match the power of the rest of the system! And it could not be more appropriately named! Replace the old Atari desktop (even if you don't have MagiC or NVDI) and start using modern features like color icons (with its included color icon editor!). Iconize windows, place icons on the desktop, substitute a right mouse click for a left double one if you'd like! It's all easy with EASE!

It is also aware of and compliant with multitasking. Includes Flexdisk, a dynamically allocated RAMdisk which expands and shrinks automatically under MagiC. Includes Correct, a program which detects and corrects file structure errors of TOS floppies and hard disks.

- Drag and Drop: Drag documents to programs -
automatically pass them as parameters!
- Hot Keys: Assign keyboard equivalents to all of your programs!
- TOS programs can run in Windows! Save sessions for future use!
- GDOS Support: Use GDOS fonts to display text in windows!
- Customizable Directory Views: Text, icons, using the system font or any GDOS font! Time, size and date can be displayed.
- Multiple columns are supported for text display!
- Free Space: The amount of available space on drives can be displayed
- The display mode can be set for each window independently.
- Searching: Look for files on multiple folders or drives!
- Spawn Multiple Directories: Every folder you open can open a new window - great for copying!
- Selected objects remain selected even when scrolling the window.
- All objects in a window can be selected with a "Hot Key."

- Programs can be listed in a special drop down menu for rapid access.
- Built in Kobold Support: Copy, move and delete functions can be taken over by the very fast file copier Kobold
- Iconization: Unclutter your desktop; "Iconize" programs and windows.

EASE 4.....$69.95

MAGIC 4: Multitasking TOS Replacement!

New Version!
Falcon users have been waiting patiently for the arrival of MagiC 3 - the first Falcon compatible version of MagiC! So many new features have been added that it would hardly be right to call it MagiC 3. MagiC 4 is an entirely new product with a new set of amazing features!

Fast Multitasking!
This multitasking replacement for TOS is pure MagiC! Traditionally, multitasking has always meant a slowdown in system performance. With MagiC, TOS was redesigned from the ground up to be fully multitasking and compatible, and as a result it runs TOS programs faster than any version of TOS! Plus, it adds preemptive multitasking! ST User magazine, February 1994, says, "It's like running an accelerator and getting the multitasking thrown in for free!" ST Review, June 1994, says, "If you want multitasking that works simply and reliably, then MagiC is for you!" MagiC 4 runs on all ST, TT, and Falcon computers with 512K of memory, but 2MB is recommended.

MagiC 4 Fast Facts:
- NEW! Runs on ST, TT, or Falcon
- New Font Selector for Choosing Your Primary System Fonts
- New Version of MagiCDesk Handles Long File Names and Color Icons
- Up to 16 Programs (or 10 programs with 6 Accessories) May Be Preemptively Multitasked
- Up to 64 Windows May Be Open Simultaneously
- Comfortable Operation with Completely New Graphical User Interface which Allows Rapid Switching Between Different Program Menus
- "Freeze" or Remove Deadlocked Programs in Memory
- Faster Printer, Serial, and MIDI Port Operation
- Programs Run Dramatically Faster than they do under TOS
- Up to 57,600 Baud on SCC-based Serial Ports (or on any ST with High Speed Serial Port Modification)
- Extended Dialog Functions: flying dialogs, keyboard equivalents within dialogs, pop-up menus, etc.
- Compatible with All Hardware Accelerators and Graphics Cards
- Improved Memory Management Prevents One Misbehaving Program from Taking the Whole System Down!

MagiC 4.....Just $99.95!

HD DRIVER 4.5 NOW AVAILABLE FOR JUST $39.95!

HD Driver 4.5 is a high-speed hard disk driver package from Europe. It is perfect for direct to disk recording because it's faster than conventional alternatives. It also includes many advanced features to make your system run faster and more smoothly.

It replaces your current AHDI or ICD driver to deliver many extra features, including faster transfer speed, easy partitioning, and more!

Features Include:
- Compatible with More SCSI Hard Disks (Newer Quantums)
- Works with Iomega ZIP Drives
- Reads and Writes DOS Media
- Support for 2 IDE Devices
- Fully MagiC Compatible
- Faster Reading and Writing
- Boot from Any Partition
- Supports Bus Arbitration
- Fully Compatible with Removable Media (SyQuest & ZIP)
- Easy to Configure
- Coexists with Alternative Operating Systems like
Linux, NetBSD and MagiC
- Fully AHDI Compatible
- CPX and ACC Configuration Programs Make Setup Easy

HD Driver.....$39.95

WHITELINE & DELTA LABS ANNOUNCE "DELTA" CD ROM!

Now available from Toad Computers are the Delta Labs Media Whiteline ALPHA, TRANSMISSION, LINUX, and NEW "DELTA" CD ROM's.

ALPHA includes:

- 4 registered full versions of the shareware programs BoxKite, Before Dawn, Poison!, and Kundendirektor
- Complete Delta Labs PD Series (130 Disks)
- 800 Signum Fonts
- 500 TrueType Fonts
- 300 GDOS Fonts
- 500 Calamus Fonts
- Programming Tools and Languages (including GNU C/C++ 2.58)
- Animations, clipart, sounds, and samples
- Falcon demos & games
- Magic Eye pictures
- Much More!!

WHITELINE ALPHA CD: Just $34.00

TRANSMISSION includes:

- Full registered versions of Golden Island and Turbo Blanker
- Complete Falcon DEMOS from THE INDEPENDENT Scene and others
- All Demos from the FRIED BITS DEMO PARTIES 1, 2 and 3
- Nearly all other demos ever made
- Falcon GAMES
- AVI, FLI, MPEG, MOD, SND, and other SOUND, MUSIC, and GRAPHICS files
- Graphic and Art programs
- LOTS OF OTHER FALCON STUFF

That's right -- the first ever FALCON ONLY CD-ROM!!

TRANSMISSION CD: Just $34.00

LINUX 68K

Linux is the alternative operating system devised in 1990 by Linus Torvalds. It was originally implemented on the 386 as a multitasking multiuser kernel that could take advantage of the VIRTUAL MACHINE / protected / enhanced mode features of that chip. The Motorola 68030 has the same kinds of capabilities, so programmers from the Internet felt it would be only natural to port Linux to the 68030. So they did!

Linux 68K is exactly that port! The CD includes the base system, the kernels, sources, binaries, X11 Release 6 (this is X-Windows in monochrome AND color!), TeX, Networking tools (TCP/IP), Emacs, GCC, G++ (C++), TOS-Cross-Compiler, DLL-Development tools, Objective C, Perl, and 3 different kernels.

That's right kids, run X-Windows on your TT or Falcon. (And yes, Linux does require a 68030 CPU and a 68882 coprocessor!)

The Linux 68K CD: Just $54.00!

DELTA

DELTA is the newest in the series and includes the following software packages:

- CyPress -- new version of the sensational Text Editor
- Kandinsky -- a great shareware Vector graphics program
- Bellini -- pixel-based graphics / page design program
- Procurator 2 -- Modular database
- Music Channel -- Musik CD Player Program
- Printing Press Gold Edition -- Home Printing Program
- MAddress -- Intuitive and Fast Addressing Program
- Chaos Unlimited GEM -- Explore the world of FRACTAL CHAOS!
- Graphbase -- A Good Picture Database/Catalog System!
- GhostScript with Acrobat PDF Support!

The Whiteline DELTA CD: Just $45.00!

ATARI COMPENDIUM ON CD-ROM WILL BE AVAILABLE IN JANUARY 1996!

The Book on CD-ROM
The Atari Compendium from SDS Publishing is without a doubt the most complete programming reference ever assembled for Atari Computers. A real must for any Atari programmer, no matter what level you are! And now the Atari Compendium is on CD-ROM in HTML format! No more flipping through pages trying to find what you need. All the information you need is right there at your fingertips, online! It couldn't be any easier or more useful.

Programming Files & Utilities, Too!
Because the Compendium now comes on CD-ROM, we can include files, examples, and programming utilities along with the great programming documentation provided by the book. Whether you're writing in GFA Basic, GNU C++, or Lattice C, you'll want to have this reference! Even if you already have the book, the extra files alone are worth the price of the CD-ROM!

Includes:
- Detailed Function Reference
- Memory Map
- Style Guide
- Speedo Character Map
- Native File Formats

Covers:
- TOS 1.0 - 5.0
- GDOS
- GEMDOS
- MiNT
- BIOS & XBIOS

Includes World-Wide-Web Browser Software
Because the Compendium CD-ROM is formatted in HTML format, we were able to include the popular WWWxxx.ZIP package right on the CD! So not only can you surf the CD, but you can surf the web, too! All you need is a local Internet service provider and a SLIP connection!

The Atari Compendium CD-ROM: Just $29.95!

NEW CD'S AVAILABLE FROM SYSTEMS FOR TOMORROW & CRAWLY CRYPT!

ALL THINGS FALCON -- JUST $19.99!

All things Falcon contains a huge selection of Falcon specific and 100% Falcon-compatible software! Prepared specifically for Falcon030 owners, none of the software on this disc requires the use of ST emulators or compatibility software. You won't even have to switch to a compatibility video mode! Includes applications, demos, games,

animations, utilities, and more!!

ELECTRONIC SPINSTER GRAPHICS ATARI CLIPART -- JUST $19.99!

Electronic Spinster Graphics has long been providing quality
clipart images to the Atari community. Now, for the first time ever, our
entire collection of PD clipart images is available on one massive CD-
ROM! Unlike other clipart CD's, this disc is specifically geared towards
Atari owners! All images are provided in IMG, CVG, and GEM/3 formats,
for easy use in virtually any Atari application. No more converting
graphics from a IBM or MAC format before you can use them! With the ESG
clipart CD, it's as simple as point, click, and load! The ESG collection
includes over 6,000 raster images (IMG), and over 1,000 vector images
(CVG & GEM/3). Topics range from animals to weddings. Also included in
this collection is a selection of PD and shareware programs for viewing
and editing images on your Atari computer!

CRAWLY CRYPT ARCHIVE: INCLUDES 1 & 2 DISCS -- Just $49.99!

Crawly Crypt Corporation is pleased to announce the availability
of the CRAWLY CRYPT ARCHIVE CD. This CD is a followup to the extremely
popular volume 1 & 2 discs and includes both of the original CD's in a
single BBS-ready compressed format.

MagiCMac VERSION 1.2.5 SHIPS FREE TO REGISTERED OWNERS!

Thanks to everyone who purchased MagiCMac from us!! As part of
your thank-you, the new updated manual as well as the version 1.2.5
update of the program (which works on PowerPC Macintoshes now) has been
sent out free to everyone who purchased MagiCMac from us! You should be
receiving it in the next few days.

For those of you who have not yet purchased MagiCMac, here is some
info about what it is and why it exists. And boy is it fast...

THE IDEA
Because the Macintosh and Atari share the same processor - the Motorola
680x0 series - it has always seemed like it would be possible to run
Atari software on a Macintosh, just as it has been possible to run Mac
software on the ST by using Dave Small's Spectre GCR Macintosh emulator.

Application Systems Heidelberg, after writing MagiC (a reverse engineered multitasking version of TOS), realized that MagiC could be recompiled to run on the Mac. MagiCMac is the fruit of that project: it is MagiC for the Macintosh.

68030, 68040 and PPC READY!
MagiCMac is not an emulator - it's a complete Atari compatible operating system that runs on Macs. After the authors were done optimizing it for the 68030 & 040 processors, they went on to make it compatible with Power Macintoshes. Now, you can run your favorite programs on a PowerMac. No kidding!

WHAT IT RUNS
When you run MagiCMac, you're obviously not using Atari hardware, so programs which rely on the specific chips inside a standard ST may not work. But these are the same kinds of programs which are not likely to run on a TT, Falcon, or Atari-clone computer, too. Almost all GEM/TOS compliant programs run on MagiCMac - very fast, too!

INTEGRATES WITH MAC
MagiCMac fully integrates with System 7. Switch between Mac programs and MagiCMac on the fly - even cut and paste data between them. You can even multitask Atari and Mac programs at the same time! MagiCMac integrates so well into the Mac environment that you'll wonder why it wasn't done sooner!

STORAGE DEVICES
- Reads and writes 720K and 1.44MB Atari floppy disks
- No need to repartition your Mac drive in order to store Atari files. Atari "Partitions" are simply folders that grow and shrink dynamically!
- Attached Atari SCSI hard disks are recognized and mounted as Atari partitions under MagiCMac. Just plug your existing Atari SCSI drives into your Mac SCSI drive chain.
- Macintosh SCSI CD-ROM drives are automatically mounted under MagiCMac and require no Atari CD driver software. Access Atari CD's quickly and easily!

PRINTING
- Print to parallel & dot-matrix printers using PowerPrint serial-to -parallel interface cable. (See below.)
- No interface is required to print to Apple QuickDraw printers using the MagiCMac version of NVDI. (The applications you wish to print from must use GDOS for output.)
- No interface is required to print to Mac printers that use PostScript, but your application must have PostScript drivers (PageStream).
- McSTout is an alternative to PowerPrint for LC bus machines. Call for more information.

OPERATING ENVIRONMENT
- Uses the award-winning EASE desktop as its desktop.
- Cut and paste between Atari and Mac Programs.

- Multitask up to 20 Atari programs and an unlimited number of Mac programs simultaneously.

DISPLAY
- Run Atari programs in all Mac display modes from monochrome to 256 colors. Supports 640 x 400 "ST Mono" resolution, too.
- Use NVDI for MagiCMac for even faster screen redraws and 16 and 24-bit color modes. Also allows use of your System 7 Mac TrueType fonts in GDOS compliant applications.

PORTS and I/O
- Appletalk Networks and Remote Access drives are directly supported. Access networked files from within the MagiCMac/Atari environment!
- Mac MIDI interfaces are supported as normal Atari MIDI ports. However, sequencers which use cartridge port copy protection are not supported because the Mac has no cartridge port.
- Use PowerPrint or McSTout for parallel printing.
- Modem port runs at up to 230,400 baud and works with standard applications like STalker and STraight FAX!

REQUIREMENTS
- Requires 8MB of RAM. Use 16 or more for best performance.
- Apple System 7, 7.5, 7.51 or 8.
- Runs on 68030, 68040 or Power PC-based Desktop or Powerbook machines of any speed.
- 68881 & 68882 math coprocessors are supported in 68030 machines. Support for the FPU of the 68040 is planned. There is no option for FPU support on the PowerPC.

"MagiCMac IS SUPER FAST! UP TO 4 TIMES FASTER THAN A TT030! USE A POWERBOOK AS A SUPER FAST PORTABLE ATARI CLONE! IT'S SIMPLY AMAZING!"

MagiCMac Accessory Products

Speed Doubler
Replaces the 680x0 emulator used for non-PPC-native programs like MagiCMac on the Power PC. Major acceleration!

NVDI for MagiCMac
Screen accelerator with enhanced color drivers and support for Speedo and all Truetype fonts! Makes AtariWorks FLY!

PowerPrint: Connect Parallel Printers to your Mac!
PowerPrint includes a serial to parallel converter cable so you can connect standard dot matrix, inkjet, and laser printers to a Mac! This alone is enough for printing with MagiCMac, but PowerPrint also includes hundreds of Mac printer drivers so you can print from your Mac programs, too! Absolutely indispensible!

MagiCMac Product Pricelist
MagiCMac v1.2.5.....On Special for just $219!
PowerPrint Cable and Drivers.....Just $109!
NVDI 3 for MagiCMac.....$99!

Connectix Speed Doubler.....$69!

APEX MEDIA and EXPOSE ARE SOME OF THE HOTTEST SELLERS THIS HOLIDAY!

Matt Norcross from Floating Fish Studios, another satisfied Toad customer, was kind enough to come down and demonstrate EXPOSE and APEX MEDIA at Toad Computers HOLIDAY FESTIVAL 95! The speed and color of the video capture were astounding. For those of you who don't yet know about APEX MEDIA and EXPOSE, here's the scoop!

Apex Media is the premier graphics/animation multimedia package for the Falcon, and Expose is a high quality true color screen digitizer for the Falcon. Together they make a formidable combination. Here is some information on them both, excerpted from our new catalog.

APEX MEDIA: GRAPHICS AND ANIMATION ON THE FALCON030

We are assaulted by synthetic images every day from every possible direction - frightening us at the movies, persuading us to buy the latest car model or laundry detergent and impressing us with flashy company logos of one sort or another. Where does it all come from? How is it done? Why can't we all have a go at it? Why not indeed...For the first time in the field of computer graphics, the public is starting to gain access to the sort of hardware that allows realistic images to be created with relative ease. It is already becoming impossible to distinguish between images created on these machines and real life.

The Atari Falcon030, for which APEX Media was exclusively designed, is probably one of the most advanced desktop computers to appear in the last couple of years. Unlike many other platforms, it has been streamlined for the purpose of low-cost multimedia, and without requiring the masses of additional hardware which have become synonymous with other more common computer systems. We see the machine more as a graphics "Laboratory" than a "Platform." APEX Media was designed as a program to take advantage of the graphics-oriented design of the Falcon030, gaining the high end performance expected of a far more expensive machine.

APEX Media is primarily an artist's or animator's tool with advanced features including morphing, image processing, retouching, video capture (digitizing with the Expose' Video Digitizer), and CFN font support built in, offering an all encompassing graphics workstation while negating the problems which are associated with constantly switching between platforms.

APEX Media allows you to create images and animations using a series of interactive tools. These tools can be used either individually, or in combination, to create complex compound effects. Flexibility is the key, and the idea behind it allows you to form your own tricks and techniques

and therefore your own style of work. Of the many people who use this program, no two use it the same way, so when using APEX Media remember there is usually more than one solution to a problem.

Workstation Performance
APEX Media is designed specifically for the Atari or C-Lab Falcon030 using 68030 and 56001 DSP machine code to provide unparalleled performance. Apex goes right to the Falcon's hardware to achieve maximum performance!

Amazing Features
APEX Media includes some of the most amazing features ever seen in a single graphics program, and represents sheer power for all forms of graphic applications - performance only seen before on dedicated graphic workstations.

Apex Intro
If you want to try APEX Media but don't want to risk $149 on a package you've never seen before, try APEX Intro. It includes all of the features of Apex Media, without the video digitizing and morphing features. This still gives you an incredible graphics arsenal including 3D modeling, texture-mapping and much more. Then upgrade for just $90!

APEX MEDIA FEATURES:

Animation & Morphing
- Smooth Image Transforms
- Powerful Block Functions
- Block rotation to any angle
- Proportional rescale, stretch, skew & mirror
- Direct-from-disk editing to allow fast and easy video titling

Digitizing
- Multiple, real-time frame capture to 512x320 in 16 bit true color
- Rostrum camera work to 24 bit
- On-screen PiP (Picture in Picture)

Post-Processing
- Dejagging, Motion blur and two levels of Noise reduction
- Advanced Deltafilm compression of animations, reducing overhead

Drawing Tools
- Pen, Line, Curve, Polygon, Circle, Box
- Stipple airbrush
- Redefinable grid

Special Features Include
- Gradated Circles, Lines, Boxes
- Interpolative Lines and Boxes
- Fill using definable Blocks or Gradients

Non-Linear Drawing
- Realistic Airbrush for producing soft graduated spray

- Transform of definable areas controlling hue,
saturation and/or brightness
- Brighten, Darken, Saturate, Watercolor and fade in with compound
inking option
- Transform and Masking of defined areas with fill or brush

Cell Manipulation
- Paste blocks above or below image
- Invert X & Y axis
- Proportional resize

Screen Modes
- Real-Time zoom at all times
- Smooth scrolling under zoom or virtual canvas operation

File Support
- PC1, IFF, SPU, PCS, TGA, MTV, JPG, GIF, FLC, SEQ, ANM, APX
- Calamus (CFN) font support
- Additional saving of Palette, Field Warp lines and setup
configuration

Video Support
- VGA, RGB monitors and TV's
- Selectable resolutions
- Virtual canvas up to 2048x1024
- 256 and true color modes

APEX MEDIA is the PREMIER graphics & animation package for the
Atari Falcon030 and Toad Computers is also happy to announce a price
reduction, too! Now, APEX MEDIA is just $149.00!

Apex Media (new low price - was $179).....Just $149.95!
Apex Intro (without digitizing or morphing).....Just $59.95!

EXPOSE -- Video Digitizer for the Falcon030!

What Is Expose'?
Expose' is an advanced video digitizer for use with the Atari and C-Lab
Falcon030 series of computers. It provides a means to "capture" live
video images, either as a single frame or a sequence of images, from a
camera or VCR in real time, with a resolution of 512x512 in true color.

What Does This All Mean?
The image from the camera or VCR is automatically processed by the RGB
Splitter and divided into three separate, analog signals: red, green and
blue (commonly referred to as RGB). The RGB signal is then diverted down
an interconnecting cable to Expose', where it is converted to a digital
format that the Falcon can interpret. Expose' then passes the image
across the Atari Falcon's internal expansion bus where it is displayed

on-screen at whatever resolution is selected within the software. All this happens in "real-time" - that is, "so quick you won't notice it's happening!"

Expose' permits this digital image to retain a 16-bitplane true color palette (or in other words, a picture containing 65,536 colors per image), thereby retaining near photographic quality. In addition, the supporting software, APEX Media (sold separately), further boosts this capability to realize even higher resolution in 24 bit color (16,777,216 colors per image). However to realize this resolution and number of colors, realistically this method can only be used to capture still images with the camera mounted on a tripod or with the VCR paused (preferably digital freeze frame).

Using Expose' and APEX Media to capture live video on the fly allows a sequence of images to be compiled into an animation, which can then be played back within APEX Media or stored as a FLIC file.

Easy to Install
Installation of the hardware into the Falcon is simplicity itself. The Expose' digitizer card plugs onto the internal expansion connector and is connected to the RGB Splitter via an interface cable.

Includes 3 Software Utilities:
FalCAM Picture in Picture (PiP) utility provides on screen, live video images within any GEM program. Watch while you work!

FalCAM Tripod Enhanced video capture software for capturing high quality, 24 bit images. Variable exposure and resolution settings, output to JPEG, GIF, TGA, and PPM file formats.

Videobox Amazing Demo! Demonstration program which texture-maps the live digitized image directly onto the surface of a cube which can in turn be spun, rotated and zoomed in real-time!

Works With Any Falcon030!
The Expose' Video Digitizer hardware is designed for operation on any Falcon030 computer and should be compatible with all hardware modifications or software enhancements.

Expose' can capture an amazing level of detail! Use with still video shots to get 768 x 576 in true color or capture 16-bit true color animation at 512 x 320! Dollar for dollar, Expose' provides the most powerful video capture on any platform!

- Maximum Resolution (rostrum work) up to 768x576 in 24-bit true color
- Maximum Resolution (real-time capture) 512x320, 16 bit true color
- Animation Resolutions (data transfer rate)
- 512x320 (6fps)
- 256x160 (17fps)

- 128x80(25fps)
- 512KB of Static RAM
- Connects to Falcon internal bus
- Inputs: S-Video, Composite
- Signal Type: NTSC or PAL
- Control: Brightness, Contrast, Color Sync & NTSC Hue
- Output: RGB

Expose': True Color Video Digitizer.....$399.00
Expose' with Apex Media.....$548.00

DIGITAL ARTS PRODUCTS ARE _HOT_!!!

Toad Computers is happy to be the official distributor for DIGITAL ARTS' line of graphics products. DA's PICTURE and LAYOUT have been particularly popular, and Rob Perry of System Solutions, London did some fantastic demonstrations of these programs on his TT030 while at TOAD HOLIDAY FESTIVAL 95!! Here is some info on all of these programs.

DA's Layout TC: Amazing Page Layout Program!

New from Europe! DAs Layout is the ultimate desktop publishing system for your Atari! DAs Layout is a pre-press program which forms the core of a highly professional print package, fully integrated with DAs Vector and DAs Picture!

Like Calamus SL it is modular and allows access to utility programs. Unlike Calamus SL, it has a system of layering to separate out elements of the document. Its modules include Page Frame, Picture and Vector editor as well as a Barcode generator and a tracer which traces bitmaps. DAs Layout has the ability to use Calamus and Postscript fonts and edit them using an included font editor.

DAs Layout has several unique features which include a powerful vector gradation and color blend generator and a transform tool which projects vectors and text into definable grids. You can even be assured of cross platform portability, because DAs Layout features postscript printing!

You can use Calamus CFN as well as Postscript Type 1 fonts, even use them both in the same page! DAs Layout even has the ability to set text on a vector curve from within the program or map a raster graphics onto a vector object. It is truly the most advanced publishing software available today on the Atari, and is better than Quark or PageMaker on other platforms!

Runs on any ST, STE, TT, Falcon or Macintosh with MagiCMac. Requires 2MB of memory and a hard disk drive. Ask About the Add-on Modules for DAs Layout! Color Calibration, Image Archive and Photoscreen Enhance Your Work!

NEW!! DAs Layout True Color.....$695.00

DA's Vector & DA's Vector Pro: Color Vector Graphics!

DAs Vector is suitable for everything from 2D vector graphics to 3D animations. Create vector shapes and do complex blends. Convert lettering (in Type One or Calamus fonts) into 2D and then 3D colored objects.

Create a series of pictures and string them together to form an animation! Convert scanned bitmap graphics to vector graphics. Generate charts and graphs quickly and easily! Graphics can be projected on to an editable grid or extruded into 3D shapes.

It allows vectors to be filled with bitmap textures or pictures. DAs Vector even has a chart generator and an animation module. It imports and exports CVG, DIG and EPS files and can print to a printer or TIFF files.

DAs Vector Pro allows the use of monochrome images for tracing and fills, vector color gradients and animated cameras with transparent color pixel gradients. Runs on any ST, STE, TT, Falcon or Mac with MagiCMac. 2MB of memory required. Runs in any resolution from monochrome to 16.7 million colors with at least 640x400 pixels.

DA's Vector.....$179.95
DA's Vector Pro.....$289.95

DA's Picture: Color Photo Editing!

DAs Picture is a powerful yet easy to use photo retouching program. The program works in full 24 bit color internally, but allows you to display and edit pictures on any 2MB Atari. It has built-in virtual memory management features, so you can work on pictures of unlimited size.

Edit color curves, use tools (such as pencil, crayon, and airbrush) and print to just about any printer, including the HP Deskjet in color! Also allows full vector masking of images, color gradients, and more! Runs on any Atari ST, STE, TT, Falcon or Macintosh running MagiCMac. 2MB of memory and hard disk are required. Fully compatible with graphic boards.

DA's Picture.....$179.95

NEW MAINTENANCE UPGRADE TO STRAIGHT FAX! ANNOUNCED

STraight FAX version 2.5 is now available to registered owners of the program. Version 2.5 makes minor changes and enhancements, and most importantly supports the Class 2.0 FAX standard in U.S. Robotics v.34 28,800 Sportster modems.

If you are a registered owner of STraight FAX and would like to get this upgrade, please contact Toad Computers. The cost of the upgrade is

$8.00. This includes a new disk and an 11 page manual addendum. Another upgrade with more significant enhancements will be available in 4-6 months.

Phil Hough (phil4@phil4.demon.co.uk) wrote:
: A friend is soon to buy a Falcon, and a monitor. What sort of Apps
: etc run on these ??? and which do you recommend he gets ???

Many demos, and some (not many) games require a RGB-monitor, or a TV.

For any "serious" use, however, a good SVGA-monitor is worth its weight
gold.

P.S - for some reason, NEC Multisync 3D and 4FG models (SVGA) don't
like Falcons at all... The display isn't good. Beware these.

Greek Things,
Tommi =)

I agree -fully- with this thread...To use an analogy, for years V-8 engines were all the "rage" but now smaller, more efficient 4 and 6 cylinder motors are much more popular. Pentiums are overkill, plain and simple...I guess that if you can't force that (bloated) code through, just use a faster processor! <grin>

Sounds like you have not got the directory set up correctly. It needs
to point to STIK_CFG\. Create a text file called STIK_DIR.DAT in the
same place as the STiK executable and put the complete path in it.
Mine is:

H:\WWW\STIK\STIK_CFG\

as an example and make sure you have the trailing backslash.

If your drive is fully Atari compatible, then you can give HDX a go. Use the
"Zero" command to wipe one single partition.

bye, Peter

807. NVDI 3, SLM605 and paper default size-how to change?

Newsgroup: comp.sys.atari.st
Date: 1996-01-13 00:00:00 UTC
From: cl152@cleveland.Freenet.Edu
Message-ID: <4d77sd$7au@madeline.INS.CWRU.Edu>
Source record: 153045

I have just installed NVDI on a 4MEG 1040 with a SLM605 printer.
The printer CPX seems to insist on DIN A4 for the paper size.
With applications that use the default paper size the print
runs off the bottom of the page. How can I get US letter size
and legal size? The makeprn.prn does not appear to allow to specify
page sizes and does not put up a dialog box with all the printers
as shown in the manual. Any and all suggestions appreciated.

Thanks

CHIASSA@UMONCTON.CA

PS Other choices of printers appear to allow US size paper.

The following Atari ST Software is for Sale:

All are 3.50 disk, have original manuals, boxes, and are in very good condition. Prices are in American funds. Shipping included in price.

Lemmings ---------- $13
Megal Lo Mania * ---------- $13
Moebius ---------- $13
Spirit of Excalibur + hint book ---------- $15
Ultima IV ---------- $13
Ultima V ---------- $13

* Mega Lo Mania needs a boot disk that changes the monitor to a different MHz. I don't have this disk but I am sure one can be found on the Internet.

The next SwapMeet is Monday, February 5th, 1996.

ACE of America, an All Computers and Electronics User Group, with a special emphasis on Atari. At ACE Swap Meets you might find Atari, Apple, Macintosh, Commodore, Amiga, IBM & Clones, Nintendo, SNES, Sega Genesis, Jaguar, Game Boy, Game Gear and Lynx. You could also find the following items to go with your system, such as Printers, MoDeMs, Monitors, Hard Drives, Disk Drives, Power Supplies, MIDI Devices, Mice, Joysticks, CD Roms, Cables, supplies and Accessories.

ALL COMPUTERS, GAME MACHINES AND ELECTRONICS ARE WELCOME!!

ACE Is currently holding Monthly Swap Meets on the First Monday of each Month from 7 PM, except on certain Holidays that we must reschedule due to our facility being closed. Swap Meets are Held at 1819 NW Everett at the NW Service Center 3 Blocks North of the corner of 18th and W Burnside in Portland, Oregon. USA! Table space is $10. Tables provided as long as they last. Show up early to get a good table, like 6:30 PM.

FREE ADMISSIONFREE ADMISSION**FREE ADMISSION**FREE ADMISSION**

At Februarys SwapMeet do we have a SweetHeart of a deal for you! A Hewlett Packard Deskjet Printer offered as a Door Prize! Any one can win, just show up for the drawing!

PLENTY OF FREE PARKINGEVERYONE WELCOME**PLENTY OF FREE PARKING**

FOR INFO CALL OUR SWAPMEET HOTLINE WITH 24 HOUR RECORDED INFO, CALL: (503)650-7196 OR FOR FURTHER INFO FROM BEN, INCLUDING TABLES: CALL FROM 3 PM - MIDNIGHT / MON-THU, FRI 3 PM - 6 PM: CALL BEN AT (503)256-9974!! IF BEN IS AWAY FROM THE PHONE, PLEASE LEAVE YOUR HOME NUMBER AND HE'LL TRY TO RETURN YOUR MESSAGE! THESE SWAP MEET SPONSORED BY ACE OF AMERICA!!

This Message is distributed throughout the Pacific NorthWest, everyone reading and their Brother is welcome to come and Attend!!

Please Direct all Replies to bensmith@teleport.com in E-Mail or call (503)650-7196 anytime.

The next SwapMeet is Monday, February 5th, 1996.

The gameplay is essentially the same. The graphics and sounds have
improved, but they're nowhere near state of the art by today's standards. I
like Dungeon master 2 on the Mac, but it hasn't progressed *that* much
IMHO.

Message-ID: <199601141200.a5094@a.maus.de>
Source record: 152854

>Does anyone know how to get the epson -lq2550 driver for the atari st
>520. The printer is a canon bjc-70 colour inkjet but canon do not do a
>driver for the st. Canon told me that the epson driver lq2550 was an
>equivalent! but i cant find an atari one!!

DON'T PANIC.

First, set the Canon to "BJ mode", "AGM on", "Text Scale on", "Autodetect Emulation on". This should do for black and white printing, as the printer then accepts any emulation from Epson or IBM 9- or 24-pin printers and still accepts its own Canon stuff (which is an extension to IBM emulation).

It even prints screen hardcopies without any extra drivers.

For color printing, leave the printer's settings as they are, and use any color Epson or IBM driver.

Note that there is no such thing as a global system driver; your applications must bring the drivers.

bye, Peter

>If it is a SIMM, there is only one slot! It would be a 4MB card,
>and there were 9 chips on it.

Don't panic. This has to be a 32-bit wide memory card. I suspect it being a
1Mx32 PS/2 SIMM. Replace with a 4x32, and end up with a 14 MB Falcon.

bye, Peter

Gee, from what I've heard about HP lately, that sounds like a *great*
prize! Do we, like, get drivers for it? Or is it an old one?

(sorry if that sounds really nasty...)

>then just let me know.

I've uploaded it to atari.archive.umich.edu (I hope) and definately to
ftp.cnam.fr (at about 17:00 14/01/96) where it should be available in
/pub/Atari/Telecomm as swampdog.tos - a self extracting zip in due
course, however long "due course" may be (I'll stop waffling).

It contains both programs and the cut down ACC version for people who
do not have multitasking.

If this was the add I posted (Link/ICDSpeed STe) about two weeks ago
both items are already sold. Sorry...

Good Luck in your search!

828. HELP ME with MiNT installation...

Newsgroup: comp.sys.atari.st
Date: 1996-01-14 00:00:00 UTC
From: jysky@sci.fi
Message-ID: <4dbc21$bn@tron.sci.fi>
Source record: 152866

Hello!

All you MiNT-wizards, please help a stupid beginner...

I'm trying to install a multi-user MiNT on my Mega 4 using the MiNT distribution kit (Setup v. 1.1, Install v. 1.2). Here's a VERY short description of my system..:

- TOS: 1.2, I guess... Not 1.4 anyway...
- Boot-partition: C
- Minix FS-partition: E

When I run the Setup program, I get:

- A correctly set up Minix-partition on E:
- Folder 'e:/usr/users/jph/bin' on E: (jph is my user ID...)
- A MINT-folder on the C-partition. Inside the folder:
- gemmint.cnx
- minix.xfs
- mint.cnf
- mintgem.cnx
- multimnt.cnx

>>> The Problem: <<<

```
**************************************************************************
* Now the problem is, that even I change the MiNT type to 'Multi-MiNT' at *
* the beginning of the Setup and after every reset, I still get just the *
* normal GEM interface after booting. *
**************************************************************************
```

I've got a feeling that I should do something about the files in the C:\MINT-folder, but WHAT..? I tried to change the paths from 'u:\etc' to 'e:\etc' and so on, but it doesn't seem to help.

Should I do something about the file 'e:/etc/csh.rc'?

I also tried to rename 'MINT.CNF' as 'MINT.CNX' and after that 'MULTIMNT.CNX' to 'MULTIMNT.CFX', changed the paths etc. in MULTIMNT.CFX, and I managed to make the shell start automatically after bootup, but the home directory wasn't found, the shell didn't find the files in e:/etc and so on...

Should I change the '\'-character in the .CNF-files to '/' as I'm using the Minix file system?

Also, when I hopefully manage to set this thing up some day, how do I create a new user account?

PLEASE help me with this -- I'm just about to blow my head off..:(

THANK YOU! :)

Get hold of Ghostlink. The archive contains the program PCSLAVE.EXE for the
PC end. It allows your PC HD to be used as an extra ST partition so you can
do all the usual file-copy etc. to move things
about.

> and cons. Does it run all the old ST software or does most of it
> fail?

If you are in the market for a new Atari then a Falcon makes good sense. It really depends what you want to do. The TT is a more 'professional' machine - but doesn't have as good graphics/sound - despite being a bit faster.

> Also, will the Falcon take a SCSI or an IDE Hard Drive right out of

Yes.

> Will it hook to a standard SVGA

Yes

> have an Ethernet Port on it like the TT machine used to?

The TT doesn't have an ethernet port. It does have a LAN port - but this unfortunatly isn't ethernet based. Its an Apple proprietry system - with which you will have real trouble connecting to anything else.

I think the Falcon has this port too - and I know the MSTE does.

:-)

>>me...
>

Hi,

It's definitely possible and works very well for me using a dynamic IP.

You could either comment out the ip addr or I use "ip addr [0.0.0.0]"
Once you login, get your assigned IP address, hereafter known as <IP>,
and from the NET> prompt, reached by pressing <RETURN> issue two
commands. at the NET> ifconfig sl0 ipaddress <IP> (press RETURN)
NET> ip address <IP> (press RETURN)

I have assigned these two commands,minus the IP address, to two function keys
and just press these inserting the assigned IP address. I haven not,however,
found a way to get NOS to automatically grab the IP ala STik and
if anyone has I would love to hear from them.

Any questions, please feel free.

>
You're confusing things. You probably mean that you want to use your ST
as an X-Windows server and your nearby Linux box shall be your X-Windows
client ? The server is the maschine that provides the "service" of
drawing graphics, using graphics hardware and appropriate software, while
the client is the maschine (or the programs run by that maschine) that
makes use of those services.

> So, I was wondering if any of y'all had any experience in doing

> any other possibilities (Minix, A/UX, Linux 68000, etc?)
>
There is quite some work to do to install all things separately. But you
can download a complete working setup : KGMD (Knarfs German MiNT
Distribution - don't be afraid, the progs are in english). With KGMD you
have a maschine that feels like a Unix maschine. You can hook it up to
your Linux maschine using the serial interface / SLIP / Mintnet, which is
all included in KGMD, and start X-Windows (also included in KGMD). You
can even run NFS (Network file system) to make the maschines share their
hard disks. Might be a little slow though. Get KGMD from :

archie> Host ftp.uni-giessen.de
archie>
archie> Location: /pub/atari/mint
archie> DIRECTORY drwxrwxr-x 512 Aug 28 12:07 KGMD-1.0

For Linux68K you need a more advanced CPU with PMMU, like the 68030. So
on your basic ST you cannot run Linux68K without hardware extensions.

Cheers Peter

domain.txt should be in the stik_cfg directory. The stik_cfg directory
should be in the root directory of what ever disk you boot from. In my
case I boot from the C drive so it is C:\STIK_CFG\DOMAIN.TXT.

In article <4d7kgn$4it@Einstein.ebicom.net>
bjr@EbiCom.net (Brian Roland) said:-

>Help!
>Can NOS work with an internet provider that uses dynamic ip addresses?

Yes it's possible! It works for me on my compuserve PPP link. I dont know exactly how to do it properly, but I have a line in my startup.nos file with which it works (and without it does not).

Add in the PPP configurations the line:

"ppp pp0 ipcp local address 0.0.0.0"

(pp0 or sl0 or any name you gave to the iface...). Now you have at startup an error message, but skip it... and after logon try to type (perhaps several times) "ip address" first you will have a "0.0.0.0" response, but after succesfull ppp negotiation with the host, you will have the dynamically allocated ip addy as a response... you're on!

If it does not work for you, I could send you my entire startup.nos by mail?
bye!

From: mfeaver@s3.sonnet.com
Message-ID: <4daoo2$mbh@sonnet1.sonnet.com>
Source record: 152931

It occurs to me that all you may have to do is zip the big file
and see if the zip archive won't fit on the 720k standard disk
(PC DOS format). Then, of course, on the Atari you would have
to unzip the archive to get your file back.

Regarding other questions, someone else may help.

The Nameless One (hopkins@smartlink.net) wrote:

: So, my question is this... Is the FALCON worth buying? Give me pros
: and cons. Does it run all the old ST software or does most of it fail?

If you are simply comparing your ST to the Falcon, yes it sure is worth
buying. However when you start looking at othr machines on the market
its much more debatable.

: Also, will the Falcon take a SCSI or an IDE Hard Drive right out of the
: box or do I need an adaptor? Will it hook to a standard SVGA monitor or
: am I stuck with the Atari Special? And finally does it have an Ethernet
: Port on it like the TT machine used to?

YEs it takes internal 2.5 inch IDE drives (3.5 inch with a bit of luck
and skill) and has a full SCSI 2 port.

You can use RGB/TV/SVGA or Multisync.

As for networks, there is a Local Talk port, but I don't really know
enough about that.

I noticed this with STonX-0.62(?) on my DX4-100. With the built in VDI it made a fair job of emulating a ST. With the X11 VDI - the speeds were in the TT/Falcon camp IIRC.

Another thing I've noticed is just how slow Linux/68 on my TT is compared to Linux/pc on my PC. True its not s straight comparison - but the TT plain doesn't execute the same programs at anything like the rate the PC can do them.

Roland.

c> I am the new proud owner of a MEGA STE. I think it has a 20MEG hard
c> file. I don't know much else about it.

It ought to have 48Mb of disk space (I think that was the standard hard drive size - a Seagate ST157N). Go to the Options menu at the desktop and select 'Install Devices' and see if you get any more drive icons on the desktop. Possibly the guy you bought it from may have switched drives on you, but 48Mb is pretty small anyway, nowadays, so I wouldn't expect so.

Virtually any SCSI drive can replace it if you want more room.

c> I started it up last night for the first time. There's not much on the
c> hard file. One thing I noticed was that the resolution on the sc1224
c> monitor resembled a CGA display. Can I get better resolution than this?

Again in the Options menu from the desktop select 'Set Preferences' and switch between Low and Medium resolutions. That should be a bit better. Select 'Save Desktop' (again in the options menu) when you're in the resolution that you prefer and it'll boot up that way in future.

If you want a higher resolution that that you need an SM124 high resolution monitor (black and white only).

c> The machine has no documentation with it - where can I get some docs?
c> What can I do with this machine?

See if you can locate a text file called YR_2_MAN.TXT. It's a bit out of date but it's a very good start. If you can't find it I can send it to you (it's about 250k)

For a commercial program Papyrus seems to be top of the range. For a PD/SW program something like Marcel might be a slightly better choice.

For terminals, lots of people like Connect (I can't stick it though). Teddy Term and Freeze Dried seem to do a decent job for a lot of people. FzDT only supports modem 1 but setting the M1EMU option in HSModem allows it to work fine with minor limitations (I've finally tested it now).

I believe you got the wrong address for this reply - I'll never use a PC for HD-recording. The available systems are either unstable or extremely expensive! Mac systems tend to be very expensive too - but at least with rather stable operation.
I'll stick to my Falcon as long as it does the job I need it for and if it finally gives up on me, I'll buy a new Falcon! :)

ST Informer is still publishing. Also, Current Notes is still publishing
but under new management. I don't have addresses handy, but both are
fairly active in the Atari newsgroups.

Source record: 152950

Rod McCall wrote:
>
> I know I've asked tis before but can anyone tell me what simms the falcon
> takes?

There are three ways to upgrade RAM on the Falcon:

1. Use a board that takes 4 4x8 SIMMS (30 pin) like Falcon Wing,
RAM Gizmo, or one board from Sweden.

2. Use a board that takes 1 72 pin 32-bit SIMM (a 4 x 32 16MB)
such as the Wizztronics board.

3. Use a BlowUP FX board and use an Atari 4MB board plus
2 1x8 30 pin SIMMs and 2 4x8 30 pin SIMMS (10+4=14).

Let me know if you need more info. We sell all of these.

863. Is FALCON worth buying?

Newsgroup: comp.sys.atari.st
Date: 1996-01-14 00:00:00 UTC
From: The Nameless One <hopkins@smartlink.net>
Message-ID: <4da8dq$3lj@frodo.smartlink.net>
Source record: 152951

I have an Atari 520 ST, vintage classic (512k ram, TOS 1.0 Rom, two single-sided drives, and a color monitor). I was thinking of upgrading the RAM and the TOS and a couple of other things. But after weighing it all out I think that just buying a new machine would be better.

So, my question is this... Is the FALCON worth buying? Give me pros and cons. Does it run all the old ST software or does most of it fail?

Also, will the Falcon take a SCSI or an IDE Hard Drive right out of the box or do I need an adaptor? Will it hook to a standard SVGA monitor or am I stuck with the Atari Special? And finally does it have an Ethernet Port on it like the TT machine used to?

Thanks in advance.

864. Floppy FAT problem

Source record: 152952

Hio!

Anyone know how to fix floppies that have corrupted FAT tables?

Well I assume that is the problem, when I open the flop I see the top level directories, but inside each one are several subdirectories and files with highly corrupted names (mostly graphic chars) and sizes. Trying to open one of these gives a read error :(

The Sanyo drive has severe firmware bugs and thus doesn't work with drivers
that insist on SCSI-2, like all the Atari drivers do. Go get a Toshiba. These
work.

bye, Peter

> Am I on the right lines here ???

There are two important ones for a 68K reset:
$0 - Reset Initial Stack Pointer
$4 - Reset Initial Program Counter

You will need to use Super() to run you routine that changes them in
supervisor mode as accessing basepage vectors is a privellaged operation
on the 68K. get a copy of Motorola 68K programmer & user manuals for full
details.

> I'm not really interested in how to program the suggestions so much as
> how to change the reset vector and use my own code, and how limited
> the vector is. The programming is my challenge !!!!

If you're not familiar enough with 68K to know the reset vector (it's
just a chip vector, not specific to the atari), then you will certainly
find this challenging.

870. FS(USA):Cool stuff for sale or trade

Newsgroup: comp.sys.atari.st
Date: 1996-01-15 00:00:00 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <4dcodb$qgg@news.fsu.edu>
Source record: 152808

- Highlights -

Modem powerusers: 16mHz MegaSTE4 with modified serial port hardware available!
Moniterm 19" 1280x1024 monitor, with graphics card for ST!
Super cheap full-page scanner!
Two Syquest 44mb removable-platter hard drives, and 20 cartridges!
Custom hard drive subsystems, with or without a Syquest!
Excellent desktop publishing software!
Some of the best games ever written for the ST, including descriptions!

Below are a bunch of ST items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

With respect to trades (or outright purchases by me), I'm particularly interested the following items. Please email me if you have any available.

1. 1040STE or 1040STFM computers (see below).
2. Jaguar systems, games, accessories.
3. Lynx systems, games, accessories.
4. T16 or ICD AdSpeed 8/16mHz switchable processor upgrades.
5. Multisync montior switchbox for Atari computers.

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheats for some of the games, and will include them with the sale/trade.

PLEASE MAKE ALL REPLIES VIA EMAIL.

****Systems****

OK, I want to get rid of my current two systems, and obtain two others to replace them. I currently have:

MegaSTE, 4mb RAM, DSDD floppy drive, TOS 2.06, 8/16mHz M68000 processor, does not have the DMA stereo sound problems sometimes present on these machines (warranty repaired by Atari), serial hardware has been upgraded using the improved GAL logic as described by the fser096.lzh file on atari.archive.umich.edu (this consisted of a one chip replacement, the new chip is more efficient and bug-free than the Atari unit). One standard ST

serial port (19,200 max), two absolutely rock-solid enhanced serial ports (115,200 and 153,600 max). This machine is completely stock, except the serial chip upgrade (which is really really nice for owners of 14400 or 28800 baud modems). Detachable keyboard (the best Atari keyboard every made, IMHO). Big wedding-cake design case, weird but cool. This machine did not come from Atari with a hard drive (as some did), but one can still get the kit to install one (includes a new plastic cover piece, and an Atari internal host adaptor). It is in like-new condition.

MegaST2, 2mb RAM, DSDD floppy drive, TOS 1.2, detachable keyboard, bog standard, perfect shape. Includes high-speed megabus internal connector (required for Moniterm 1280x1024 and other graphics cards).

And instead, I want:

1040STE, 4mb RAM, TOS 1.62, internal DSDD drive, clean (no roach-colored smoke-stained music studio machines please). In my wildest dreams, I would find one with a T16 or ICD AdSpeed 8/16mHz switchable processor upgrade installed. Barring that, I'd like to find such an upgrade and install it.

1040STFM, 4mb RAM done with some decent memory upgrade board, TOS 1.0, clean, ditto on the processor upgrade.

Why? Since moving my work environment over to my beast of a Linux box, most of my ST time is spent playing kick-ass arcade games, for which there are few PC analogues (I've got plenty of excellent PC games as well, but sometimes I feel like racking up a few zillion points in Revenge of the Mutant Camels, eh?). I'd like to move my ST gaming out to the big TV in my living room. My current systems have to be desk-based, as they have detachable keyboards (plus the Mega2 doesn't have an RF modulator). Also, the MegaSTE has some irritating compatibility problems with older games, due to TOS 2.0x's slightly modified bootup routine. It is, however, the best 68000 based ST/STe ever made by Atari, IMHO. For those used to a stock 8mHz ST/STe, they scream (granted, a fairly weak scream by today's standards, but dramatically faster than 8mHz boxes). Screen response time that can match current 28,800 baud modem technology can be attained, along with the serial hardware needed to get full performance from these devices. Those games that can handle both TOS 2.06 and 16mHz mode are usually MUCH better that way.

(Jeez, what a shameless plug. It is a sweet machine, though.)

Anyway, I'd like to replace my two systems with two of the "one piece" design, both with RF modulators for easy TV hookup. IMHO, my current systems are superior for serious work (the detachable keyboards are great, plus all the other nice things about MegaST/STE machines), but inferior for the kind of gaming I want to do. Ideally, I'll be able to preserve my 16mHz capabilities via a processor upgrade.

If you have a machine that fits my bill, and would like to sell or trade it, please let me know. If you just want one of mine, email me an offer.

****Other Hardware****

Moniterm 19" 1280x1024 paper-white monochrome display, absolutely the best way to do DTP (and just about any other kind of serious work) on the ST. Comes with the special video card that plugs into the Megabus on MegaST machines, plus software drivers. Case is cracked in a couple of places, but still perfectly functional. Requires TOS 1.4 or higher. Virtually all "serious" software supports the higher resolutions without modification (all GEM compliant programs are supposed to check, and most do). The desktop is HUGE, equivalent to slightly more than 4 normal monochrome displays. For DTP users, you can see two full 8x11 pages side-by-side at actual size. The display is sharp and easy on the eyes, like a well-adjusted SM124. Shipping costs would be nontrivial on this item, as it weighs a ton. This is definitely "poweruser" material. Unless you have some sort of custom graphics card, you MUST have a MegaST machine (not MegaSTE) for the included graphics card to work (of course, I happen to have.... :-).

Img Scan, optical scanning head that attaches to most dot matrix print heads to produce a scanner. The printer is used to position the material to be scanned, and is capable of very high accuracy. Great way to start playing with scanning technology. Several versions of the software included. Plugs into the cartridge port.

Spectre GCR, cartridge and software that will emulate a Mac Plus, including Mac floppy operations. Latest version (3.0) of software included. I can also provide Syquest 44mb cartridges with the Mac system software preinstalled (Syquests work perfectly in Mac emulation mode).

Monitor Master monitor switchbox, switch between color and mono displays with the push of a button. Also provides sound and video output jacks.

Syquest SQ555 44mb removable platter hard drive, fully supported by all Atari hard drive software. Standard 50 pin SCSI interface, 5.25 half height, bare device. I have two of these available.

Syquest 44mb cartridges, made by Syquest. I have 20 of them, no bad sectors, factory plastic library case included with each.

Quantum Prodrive 80S 80mb 3.5" hard drive, standard 50 pin SCSI.

Seagate ST296N 85mb 5.25" half height hard drive, old and huge yet reliable as a rock (for me, at least, as it was my first drive :-).

ICD AdSCSI Plus host adaptor card, includes card, DMA cable, ICD manual, version 6.55 of the ICD utilities, 50 pin internal SCSI ribbon cable, mounting hardware.

I have a few hard drive enclosures, and could produce a nice external hard drive subsystem for the ST using any combination of the storage devices listed above. Syquests are extremely cool, particularly for making backups (Diamond Edge can do a 44mb partition copy in just a few minutes, really really fast). So, if there is interest in a plug-and-play hard drive subsystem, let me know.

****PC Hardware****

Adaptec 2940W PCI Fast-Wide SCSI-2 disk controller, one of the fastest SCSI controllers available for the PC, OEM version, still factory sealed (i.e. totally unused). Includes card, cable, manual, driver software. Supported by DOS, Windows, Windows 95, Netware (Novell), Solaris x86, Linux, etc. This card provides connections for both Fast SCSI-2 (50 pin) and Fast-Wide SCSI-2 (67 pin) devices. These go for around $300 in Computer Shopper.

****Application and Utility****

ExtenDOS v.1.21, software to allow use of standard SCSI CDROM drives on Atari ST machines.

Tacklebox ST, This consists of a huge 3-ring binder reference manual (about 4 inches thick) packed full of information about all of the Atari programatic interfaces (GEM, AES, TOS, GDOS, etc. etc.), plus a bunch of info about hardware, memory map, Pascal tutorials, etc. It is VERY comprehensive (it even has the entire Motorola OEM manual for the 68000 processor in it!). It also comes with a couple of disks with sample code in Personal Pascal.

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

Degas Elite, one of the best ST drawing programs, can edit or create P?1, P?2, P?3 files.

Pagestream 2.20b, complete DTP system, can produce output on a variety of devices, including PostScript. Comes with a bunch of fonts.

Page Assistant, excellent hypertext help accessory for Pagestream. This product makes Pagestream a vastly more user friendly product. The online manuals provided are better than the printed one that comes with Pagestream. Really a must-have item for Pagestream users. This combo provides a powerful DTP environment.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers, includes a bunch of 150 and 300dpi fonts. Claims to be 200-500% faster than other HP drivers (for that time, I don't know if there are faster ones out now).

Image Cat, Wizworks, v1.0e, this program catalogs all kinds of image files (.img, .pi1, .pi2, .pi3, .pc1, .pc2, .pc3, .tny, .neo, Macpaint). It makes "summary" or "thumbnail" sheets which have the images on them (reduced), with file name and directory information. You just point it at a directory and it prints out the images. This is great for DTP folks with a lot of clip art. Printer drivers for SLM804, HP Desk/laserjet, NEC LC890, Panasonic KX-P4450, Epson LQ and FX.

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft product ever made for the Atari that I know of, includes a full copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,

did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is usable, though certainly not
state of the art.

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES****

Games marked with a * are, in my personal opinion, really killer games. No
ST game collection should be without them.

* Dungeon Master, one of the best 1st person graphic adventure games ever. An
absolute classic for the ST. Will include a disk of maps for all the
levels, and a nice spell chart. No ST owner should be missing this
game! No box.

* Chaos Strikes Back, sequel to Dungeon Master, another classic. No Box.

* Populous II, extremely cool god-game, one of the best ST games ever
produced IMHO. STE enhanced.

* Time Bandit, one of first ST games ever, Michtron. This is yet another
classic that no ST should be without.

* Operation Thunderbolt, sequel to the arcade game with the plastic Uzi
submachine gun mounted on it. Uses mouse for control, excellent
"blast everything" game. Great explosion and gunshot samples.

* Warhead, excellent space flight/combat adventure game, exceptional 3D filled
vector graphics and sound.

* Magic Pockets, platform game by the Bitmap Brothers.

* Escape from the Planet of the Robot Monsters, cool two player simultaneous
game.

* Vroom and Vroom 2, my favorite ST driving game, uses mouse for all controls,
nice filled vector graphics, very very fast.

* Speedball 2, bionic-enhanced brutal futuristic football, excellent two player
simultaneous game.

* Thunderhawk, one of the best combat flight simulators for the ST, pilot a
futuristic gunship all over the world. Filled 3D vector graphics,
excellent flight engine.

* Elite, starfaring free-for-all adventure game, a classic for the ST.

* Robocop 3, awesome ST arcade game, includes a combat driving game, 3D third-
person fighting game (virtua-fighter style, though not as pretty),
and a Doom-style 1st-person shoot'em up phase (no texture mapping,

bummer). Great game. STe enhanced.

* Menace, Psygnosis, side-scrolling "blast everything" game, very fast, very good. This is the precursor to Blood Money.

* Hard Drivin 2, 3D filled vector driving game, stunt and racing tracks, can play via serial link with ST, Amiga, or IBM PC versions of the same game.

* Armourgeddon, Psygnosis, excellent combo-game, battle a variety of enemy craft in a huge virtual world while piloting hovercraft, tanks, jets, gunships, or bombers. Cool combination of arcade action and strategy. Two player cooperative play via serial link, really cool that way.

* Wanderer 3D, super-cheesy game with one overwhelming redeeming feature: 3D glasses are included. Pretty nifty, though you will go blind if you play too much :-).

* Super Hang-on, one of the best motorcycle racing games for the ST.

* Prince of Persia, platform game, but with much finer control of the computer player than most such games. Cool swordfighting phases coupled with challenging level-completions.

* Gold of the Aztecs, platform game with huge sprites, great graphics and sound.

* North and South, strategy wargame with lots of tongue-in-cheek humor, based on the popular French comic. Very well done, and can be configured to play itself. Really shows off an ST.

* Flight of the Intruder, Spectrum Holobyte, full-blown Vietnam flight simulator using an improved version of the Falcon flight engine, pilot A6 Intruder or F4 Phantom jets, serial-linkable two player (awesome head-to-head fighting is possible with two machines).

* Hostage Rescue Mission, control the actions of a team of elite counter-terrorist troops. Great blend of strategy and arcade action.

Driller, 3D filled vector first person arcade adventure, huge game space, similar to Descent on the PC (no texture mapping, of course).

* Stunt Car Racer, One of the best car racing games for the ST. Two player null-modem game is excellent. Original disk, xeroxed docs (I lost my original docs).

Moon Patrol, Yes, the original arcade game. Side-scrolling car game, jump over holes and shoot flying saucers. Conversion done by Atari, just like the original. Original disk, no docs or box (docs are not needed for this game).

Blacklamp, side-view platform game. Collect all the lamps to fight the dragon. Excellent graphics and gameplay.

Barbarian II, This is the sequel to Deathsword, the one or two player sword-fighting game. It is not the Psygnosis adventure game. This is a blood and guts action fighting game. Excellent.

Double Dragon, one of the first beat'em-ups for the ST. Dual player mode is cool. Multilevel side-view platform fighting game. Good. Original disk, no docs/box (unneeded for the game).

Sega Master Mix, this consists of five separate games: Super Wonder Boy (cute isometric arcade game), Turbo Outrun (Ferrari driving game), Thunderblade (combat helicopter game), Dynamic Dux (isometric arcade game, punch bad guys, cute, fun two-player simultaneous), and Crackdown (isometric view "go kill all the bad drug dealers"). All of these are arcade conversions, and all are of good quality.

Awesome, Psygnosis, Several different types of action game rolled into one. Excellent shoot-em up game, graphics, sound, and gameplay all first rate. This one really shows off the machine.

* Wrath of the Demon, side-view scrolling action/adventure, excellent graphics, sound, and gameplay. Four disks (!), extremely challenging, STE enhanced. This is another one that really maxes out the ST/STE hardware.

* F-19 Stealth Fighter, Microprose flight sim, lots of maps, manuals, keyboard templates, etc. Excellent simulation, allows one to fly either the F117 or the F19 (hypothetical plane based on early artist's conceptions of the stealth project).

Swiv, overhead view jeep/helicopter shoot'em-up. Simultaneous two player mode, STE enhanced graphics and sound (will work on ST as well).

* Jupiter's Masterdrive, Ubi Soft, excellent excellent overhead-view driving game with guns. Drive on the moons of Jupiter. Extremely cool simultaneous split-screen two-player mode.

* The Chaos Engine, Bitmap Brothers, STE enhanced overhead-view one or two player simultaneous game, excellent graphics and gameplay. The Bitmap Bros. don't make a crappy game. This one is great. For MegaSTE owners, I can provide a version of the game that works on this machine.

* Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two simultaneous players. Plenty of fast and furious shooting, lots of weapons, little droids that follow you around and help you out, big ugly aliens, etc. Great game.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II in space, best with two simultaneous players (screen is split to give each player their own view). Overhead view, destruction galore.

* Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action). Future setting, sideways scrolling, large sprites, good guns. This is a pretty hard game, but lots of fun.

Sidearms, Capcom, scrolling sideview shoot'em up, mouse controlled, lots of weapons and powerups. Great "mindless destruction" game.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross country motorcycle racing game, Crazy Cars is a racing game. Both are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Eliminator, strange driving/shoot'em up game, lots of different weapons and bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small child (in terms of its difficulty). A bit boring for us big children, IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics are quite lame (mostly text, in fact), but I suppose a political process fan might like it. It does not appear to be particularly tied to the 1988 elections, and has data for US elections all the way back to 1960. Can apparently be used to predict elections as well.

****ST Action Magazines (with coverdisks)****

Issues available: 26, 43, 50, 51, 53, 54, 55, 56, 57, all include coverdisks.

These mags are great for game fans. The reviews help one avoid poor games and select good ones, plus there are cheats for the games, how-to-play guides, and useful non-game related articles (hardware reviews, expansions, etc.). Also, they all have a "best ST games to date" list in them, which is a great way to select the "best of the best" when game shopping (for example, from discount houses who only list the names of the products, with no descriptions). Finally, the cover disks that come with the mags provide demos of games (so you can try before you buy), plus full PD/Shareware games and other software. Most come with two disks.

Also available: three ST Action binders, each will hold about 12-14 issues without any damage or modification (wire-in-the-middle style) and make it convenient to leaf through the mags. Sold/traded only as a group. These are well made, nice looking binders with the ST Action logo on them. Will hold any of the large format UK magazines (A4 size, I think).

Subject: Atari ST and Winsock
To: mcurrent@carleton.edu
X-Url: http://zippy.sonoma.edu/~kendrick/nbs/new_and_emu.html

Hi Michael, A friend is having trouble connecting to our PPP services at the university. Do you know of any dial-up winsock she can use to connect? Please advise. Thanx, Jim (jhamman@csus.edu)

I'm using an Atari ST with CAB and STiK for browsing the web, dialing in at 19,200 bps.. The browser works with other BBS's that support SLIP, I have even tried logging on with my friends computer via SLIP and it would not work, PPP works great but as of right know STiK which is like Trumpet and CAB that's like Netscape only support SLIP.. Any help would be appreciated..

[] join on both the PC and ST side

I've never got this to work, either the version released on a magazine
or via the 2 different friends who tried to compile the distributed PC
source.. works great splitting files across multiple disks on an Atari
but not between an Atari and a PC.

Anybody got any idea what I could be doing wrong?

Hello,

How can I turn off screen&HD on my stacy by software?

Has the stacy TOS some new functions? If so, how can I check the availability of these?

If you know how to do it, please send me some hints or assembler/pascal or modula-2 source!

thanx,

Simi

[] I tried ghostlink and had problems.

Me too... I did get it running as described above, but, had to run
PCSLAVE.EXE from DOS. It won't even work from the MSDOS prompt in
$windows and I had to exit $windows completely to get it to work.

[] You could try UUEncoding into bite-size lumps (or just split a big
[] UUE file with a text editor), transfer on floppy, reassemble on the
[] other machine and then UUDecode. Works for me.

There is also a PC version of the shareware ESS-Code, (which seems
more recent than the atari version - 6.4) that should enable you to
split and join files, between the PC and Atari. The shareware version
also allows you to split binaries/zips without having to uuencode them
first, however the unregistered version does split binaries into lots
and lots of very small files.

jason.

PLEASE MAKE ALL REPLIES VIA EMAIL

I'm looking for some Atari items. They are:

1. 1040STE computer, clean, TOS 1.62.
2. Jaguar systems, games, accessories.
3. Lynx systems, games, accessories.
4. T16 or ICD AdSpeed 8/16mHz switchable processor upgrades.
5. Multisync montior switchbox for Atari computers.

Please email me if you have any available. If there is interest in a trade,
I have a forsale posting out on comp.sys.atari.st (the subject line on that
post is "FS(USA):Cool stuff for sale or trade") that has a bunch of potential
trading stuff in it.

- Highlights from my forsale post -

Modem powerusers: 16mHz MegaSTE4 with modified serial port hardware available!
Moniterm 19" 1280x1024 monitor, with graphics card for ST!
Super cheap full-page scanner!
Two Syquest 44mb removable-platter hard drives, and 20 cartridges!
Custom hard drive subsystems, with or without a Syquest!
Excellent desktop publishing software!
Some of the best games ever written for the ST, including descriptions!

In article <4da8dq$3lj@frodo.smartlink.net>
The Nameless One <hopkins@smartlink.net> said:-

> So, my question is this... Is the FALCON worth buying? Give me pros
>and cons. Does it run all the old ST software or does most of it fail?

It depends on what software you run\like already. If like me you have been
a fiend collecting prgs (and updating them regularly) you will find most\all
things will run. All that runs on a TT or Mega STe seems to run just fine
as will the majority of stuff postSTe.(There is a roumour that the falcon
dislikes gfa and omicron basic writen programs but I've only noticed this
with TeddyTerm which some people find no problems with. CoNnect is a dream)

With some trepidation here is a short list of what I regularly use.
Connect v2.46
Straight Fax v2.2
Thats Write v3
Apex (the real reason to buy a falcon)
Oasis v1.35
Idealist v1.37 ?
ImmageCopy v3
Calamus SL
Kivi Qwk
Easy Draw v3 (some glitches here but hey its running under NVDI 3!)
Stik\www browser package v1.16(this is so sweet to see on a falc)

The following are shareware but commercial quality (as are most of the above!)
and to my knowledge still being developed\supported
Kandinsky (better than EasyDraw but i'm not conversant with it yet)
Family Tree (genealogy package)
Everest
Freedom (superb file selector)
Thing (replacement desktop)

The full list is endless (or seems so when typing at my speed!)
Anything newly written for the atari seems to be written for the falc and
made backward compatible as an afterthought so it maybe runns on an st.

> Also, will the Falcon take a SCSI or an IDE Hard Drive right out of the
>box or do I need an adaptor? Will it hook to a standard SVGA monitor or
>am I stuck with the Atari Special? And finally does it have an Ethernet
>Port on it like the TT machine used to?

PROs The Falcons Hard drive port is SCSI I\II and takes all those
standard bits in the mags, CDroms, ZipDrives.
Internally it utilizes standard 2.5inch IDEs

It uses standard S\VGA monitors for all day to day applications.
It can output to a tv with or without scart or RGB monitor
for HI-REZ HI-COLOUR(demos+some games)
Some mulit-syncs do the lot.

It has the same LANport as the TT (AFAIK)

There are built in compatibility modes accessed from the desktop
to downgrade the machine to run difficult (old) programmes.

CONS Drivers are required for some SCSI add ons ieCD ZIP Scanners etc
Extendos Pro seems to offer most (45UKpounds approx)

The Video port itself is NON standard and needs a small cheap gizmo
SVGA support is only fully available via extra hardware.(50 ukp
aprx) ie 800X600 256colours

Irritatingly, having fixed the STe to support standard simms
most falcons have regressed to "Atari" memory on a card (GROAN)

There is a Backwards utility (shareware) to use still more
difficult programs. It works well but I've never really needed it.

Hi-rez"truecolor" on RGB is flickervision(interlaced) and a drag.

Even these cons are hard to find (for a dedicated Atarian) and the wealth of
dedicated Falcon software (especially DSP enhanced stuff) is getting better all
the time.

It boils down to this,

Yes, a Pentium IS a gobsmackingly good machine if you need to bring stuff home
from the office and want to get at all those cdrom books and games from
PUTRS'R'US but it is still a high cost for a good machine.

Plus How much will the new software be to replace all your old faves?
Do you really want to support Bill Gates and his crappy programming
which saps the strength of the Pentiums power?

If you have a lot of software and like Ataris, with the 2nd hand prices of
falcons at the moment it's no contest.

> Thanks in advance. >

If you want to mail me your list of what you want to run on a Falcon I'll try
to comment on it.

I know i'm biased...but what the hell!

Cheers from the spirit demon and good luck.

rgivan@cix.compulink.co.uk ("Roland Givan") spake thusly:

Subject: Re:
"G> *** HE ALSO PLAYED AUDIO & VIDEO on his FALCON! *** VERDAD?

uk> , mdg@ukc.ac.uk said:

> For RAW power a Pentium 100mhz is about 4-10 times faster
> than a Falcon. With the DSP it can match a Pentium in some
> areas. However

"G> Amybody know how a 486DX4-100 compares?

Back in the dark ages before I started playing with computers, I had occasion to read up on the benchmarks attributed to XTs, ATs, 386s, and 486s (then new). And I noticed a strange thing. The Norton Benchmarks for these machines indicated that the only real differences throughout the range between the AT and the 486 was clock speed. I wonder why no one ever mentions this. About that time, the Norton benchmarks were being superseded by something different.

One of the few pc types (local guru) that I know claims that his DX66 is slightly *faster* than a DX100, or a Pentium. Is he just whistling in the wind? He seemed vaguely surprised by the results.

> A good example of the magnitude of difference in power between
> the two machines is the fact that a 100mhz pentium can emulate
> a 68030 at faster than TT speed. Even a 68000 emulator written
> in C (STonX) on a fast Pentium is about 20% faster than a
> Falcon.

"G> I noticed this with STonX-0.62(?) on my DX4-100. With the
"G> built in VDI it made a fair job of emulating a ST. With the
"G> X11 VDI - the speeds were in the TT/Falcon camp IIRC. Another
"G> thing I've noticed is just how slow Linux/68 on my TT is
"G> compared to Linux/pc on my PC. True its not s straight
"G> comparison - but the TT plain doesn't execute the same
"G> programs at anything like the rate the PC can do them.
"G> Roland. @CiX

Forgive me for stating the obvious, but: 1) comparing how a given computer emulates another simply tells you which one has a *lot* more hardware capability. 2) Comparing Linux/pc on a 486DX4/100 to Linux 68K on a TT (68030 at 32Mhz) simply tells you that the 486 has a lot more horsepower. Which we knew. (It ought to be at least 3 times faster, just on the clock speed. Is it?)

If this debate is about what silicon box has got more junctions in it running at higher temperatures, then the only argument is between Pentiums, PowerPCs, and upwards. If it is about ease of use and speed of real-world applications, we Atari users can stay in the game for a while - maybe a long while if the Eagle flies and 'our' programmers stay interested in the platform. If not, well....

886. More Falcon questions

Newsgroup: comp.sys.atari.st
Date: 1996-01-15 00:00:00 UTC
From: msh@den.mmc.com
Message-ID: <4deelu$ouc@tel.den.mmc.com>
Source record: 152876

Many thanks for the helpful replies I received from Bruno Lavigne, Keith Tomlin, and David Greenhough. The information they sent me gave me a basis for more questions:

1. Where is the 24-bit address limit imposed? (Bruno stated that ST-RAM has 24 bits of address, but TT-RAM has 32 bits.) Is it at the bus level? The MMU? From comments I've read here, I would guess that, even if TT-RAM has 32-bit addressing capability, there is some other limit inherent in the Falcon's HW that would prevent it from being able to address more than 16MB linearly? (I hope that's not true!)

2. Since the slower ST-RAM is shared with video/DMA and TT-RAM isn't, you could not run a Falcon with 100% TT-RAM, could you? (4MB ST-RAM/ 10MB TT-RAM seems an ugly hack to me. :^( )

3. BlowUpFX speeds up individual chips but not the bus(es), right? So only processing of in-cache data would be faster, but processing of out-of-cache data would still be limited by bus speed?

4. Is there any way to increase actual bus speeds on the Falcon (along with increases in processor clock speeds)?

5. Could someone please be so kind as to post/mail specs for the Afterburner 040? That sounds like *my* kind of HW upgrade!! :^)

6. I read with disappointment the recent articles about the TT and Falcon having LocalTalk (yecchh!) ports and not Ethernet ports. Is there any product that would give them true Ethernet capability?

Again, thanks in advance for your helpfulness!

887. Desparately need CAB/STIK help!

Newsgroup: comp.sys.atari.st
Date: 1996-01-15 00:00:00 UTC
From: daymon@sierra.valleynet.com
Message-ID: <4delqj$asi@alpine.valleynet.com>
Source record: 152877

Hey! All you CAB/STiK users out there! I need help! Here's the problem:

Whenever I try to access a URL, it seems to not want to receive any data (i.e. "Receive data (0 bytes)" until CAB times out). I've checked, double-checked, triple-check, etc my default.cfg, dial.scr, and hosta files along with help from my internet provider. I've also tried every trick I've seen posted to this newsgroup and nothing seems to get it to work. I've tried old and new versions of CAB/STiK and it's the same story. IRC, Telnet, and Forcast also won't receive anything. Has anyone else experienced this? Does anyone have any suggestions? I've e-mailed every CAB/STiK related address I can find and no one has responded in well over a week. I'm currently paying more for a SLIP/PPP account (as opposed to a shell account) and I can't access it. HELP! My system is very basic (could this be a problem?): 1040ST, 1Mb, no HD, TOS 1.0, 144k modem. I'd *REALLY* appreciate any suggestions. Thanks!

Mike Freeman

888. Handy Atari tidbits for sale.

Newsgroup: comp.sys.atari.st

From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DL7KBF.MzF@actrix.gen.nz>
Source record: 152878

Slight revision on the stuff I'm trying to get rid of so I can afford some bigger & better stuff :)

ICD-Link (The original). Plug most SCSI devices into your ST with nothing more than this cable. Any device you can disable parity on, will work, (the vast majority of hard-disks). Includes v6.5.5 of the ICD-Link software. $30

Happy-Copier/Discovery Cartridge. Will copy any disk, even the most heavily copy protected ones, so if your disk-drive eats them, it's no longer a problem, as you've got a backup! (The only disks it can't copy are the Space-Ace/Dragons Lair series although I have a theory that will fix this as well, but as I sold my copy of DL, it doesn't worry me anymore :) $25

Spectre-GCR. Includes Macintosh ROMs. v3.0 of the software. v6.0.5 of the Macintosh finder/system software (apparently the most stable version - it's all on the proper install disks as well!) The manuals, and various essential bits of PD/SW software such as Z-Term, Stuffit, Mac-Binary, drivers for "normal" (ST-compatible) printers. $90 (You won't find a deal like this elsewhere, I recommended 4meg of RAM and at least a 15Meg partition, but this thing emulates a Mac-Plus pretty much flawlessly!)

Migraph hand-scanner, as new. 400DPI scanning, plugs into the cartridge port. Includes v1.84 of touchup, as well as all the manuals. This is about the best hand-scanner you can get for the ST, includes scanner, power supply (USA), cartridge interface, touch-up and documentation. Does 100, 200, 300 & 400 DPI, has automatic dithering (3 levels) or "photo" mode. Adjustable sensitivity (light/dark). Works great. $95

Or, I'll send you the whole lot, for a mere $200 (Including shipping)! Shipping is negotiable on all items, but to get it quickly ain't cheap!

So:

ICD-Link $30
Happy Copier $25
Spectre-GCR $90
Migraph Scanner $95

Or the lot: $200 (A saving of over $40 'cos shipping is included :)

Or heck, I'll swap it all for a Jaguar and a couple of cart's! (Preferably one without any "quirks", and with suitably mindlessly violent games such as Doom, Wolf-3D, AvP, or Rayman, or heck, pretty much anything (I've played em all, so I know what's good :)

262 uses the RSAREF library, which is patented in the USA, so you're not
allowed to use anything else over there.
262i (the international version) uses another implementation of the RSA
algoritms, written by Phil Zimmerman (before the legal problems with the
owners of RSAREF).
The two versions do the same thing, only the legal situation is different
for both.

Add the following line as your first ppp parameter statement in
STARTUP.NOS:

ppp sl0 ipcp local address 0.0.0.0

Then add this as the last line in your DIAL.TXT:

status up

I've had a play, and it does work. Also, just commenting out the "ip
addr" line in STARTUP.NOS also got results. Initially "ppp sl0"
revealed a zero IP address but after a few seconds it somehow got the
address. Could you let me know if this works reliably because my
provider has been having problems again this weekend so I can't be
sure.

Cheers

Guy

First I live in Raleigh, North Carolina. And you will have to
pick this stuff up.

I have a 1040ST that is taking up space in the garage.
Basically if you can come and get it it is yours.
The system includes:

1040STfm
2.5 meg of memory
DSDD drive
ICD Adspeed-ST (16mHz Accellerator)
Hard drive case with:
ICD Host adapter/clock
Room for one 5.25"/3.5" half height drive
5.25" floppy (If you remove this you
can add a second HD)
External DSDD floppy.
Monochrome monitor
Color monitor (works sometimes)
Monitor Master (Original)
Multi-Sync monitor adapter from toad.
A rather large collection of computer
related stuff.

What do I want for this???

Either:
a) A couple Lynx games (Klax and Chip's Challenge would be nice)
b) A Bench type beer bottle capper.

email me if you are interested.

Brian

Hi Carl,

SHEER AGONY costs 29 UKP, and about 295 DKr, which must be about 305 SKr.

You can propably get it from Indigo2 in Denmark, since Indigo2 has a deal
with 16/32 Systems in the UK who distributes SHEER AGONY.

904. Falcon for sale in US

Newsgroup: comp.sys.atari.st
Date: 1996-01-15 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <96015.102234STIRRE31@MAINE.MAINE.EDU>
Source record: 152894

My Falcon is still for sale. Hopefully peoples' wallets have recouped
from Christmas :-). Below is what I have for my system. The price
is negotiable so please make an offer. If anyone gives me $650 +
shipping I will include a Lynx with over 20 games for free.

I am selling my Falcon030. I am waiting to sell it after December
22, though, as I would like to wait until after my current semester
here at school.
Here is the info on the machine:
4 megs of RAM, 85 meg hard drive, TOS version 4.04. Unmodified
except for the internal speakers being disconnected. The only problem
that I have had with this machine is that the microphone port
sometimes does not work. I do not know why.
Here is what comes with the machine:
Hardware/accessories:
Koss SA/35 cheap external speakers (they do sound nice, though)
Golden Image Mouse (very nice mouse)
Jaguar Joypad
2400 baud Hayes modem
Software:
All of Atari's preloaded software such as AtariWorks and SpeedoGDOS
NVDI 3.01
Pagestream 2.2
Fleet Street Publisher 2
Marcel (registered)
STeno 1.04
STalker 2 (not the latest version)
Typesetter Elite
ST Word
Personal Pascal
1st Basic
Griff's DSP MPEG player (registered)
ST Data
ST Calc
Speed of Light (registered)
GFA Basic
Solutions
Street Fighter II
Elite II
Civilization
Asteroidia (registered)
Square Off! (registered)
Triple Yahoo (registered)
Super Bomberman (registered)

Winglord (registered)
Star Wars
Star Raiders
Pirates!
Gunship
Roadblasters
Space Quest
Police Quest II
Hoyle's Book of Games
Midi Maze
Moebius
Dungeon Master
Test Drive
Guild of Thieves
Impossible Mission II
Flight Simulator II
ST Format cover disks (maybe 10-20)
There is probably some things that I have forgotten as well. All software listed is bought and not pirated. I have manuals for most everything and original disks for everything.
As this system comes with quite a bit of goodies, I was looking for around $800. Again, I have had troubles with the microphone port so I do not promise this will work. If interested, please drop me an e-mail.

The Nameless One (hopkins@smartlink.net) wrote:
:
: I have an Atari 520 ST, vintage classic (512k ram, TOS 1.0 Rom, two
: single-sided drives, and a color monitor). I was thinking of upgrading
: the RAM and the TOS and a couple of other things. But after weighing it
: all out I think that just buying a new machine would be better.

I wouldn't think twice.

: So, my question is this... Is the FALCON worth buying? Give me pros
: and cons. Does it run all the old ST software or does most of it fail?

It seems to me, most Falcon-owners definitely LOVE their birds (I do ;-) - and those of us owning something else don't like Falcon that much. Who do you believe, that's the Question ;-) ?

I haven't regretting purchasing one for a second. Falcon needs some tuning before it can be fully recommended IMHO. Therefore, it's not a cheap solution compared to PCs and Macs. Fortunately, it _isn't_ a PC or a Mac, either =) !

Here's my "list of things required to make Falcon a *great* computer:
- NVDI 3.02 or 4 (absolutely necessary for all TOS computers, I think)
- A separate keyboard (unless you can live with the original..)
- FX Fast RAM card / Screen Enhancer / Speeder (after THIS, you don't really
even think about abandoning your bird ;-)

If you don't want to spend money on such things, make sure to get at least
NVDI 3/4. One thing I've noticed about F-030 is that it's a much more reliable computer to work with than any ST/STE/Mega I've ever worked with. It doesn't
"bomb" easily, and even if it does, you can mostly continue your work immediately. Something impossible for ST-models (bombs -> reset or cold boot, always!).

Also, though the specs might not be so impressive, it's pretty easy to create yourself a very pleasant working environment. I use 816x608 resolution in 256 colors, 67 hz non-interlaced. Perfect! And due to my Fast-RAM and NVDI, it really works FAST, too! Using image processors, or even Calamus goes swiftly.

The ST-compatibility is another thing. A program called "Backwards" (Shareware) allows one to use most ST-only programs without much trouble. Still, I've found the after using modern Atari software, you really don't even want to use older ST-software, if you can avoid it... There are _very_ few such ST-only programs you couldn't well replace with something newer.

The only thing you probably have to give up, is the ST-demo scene. But who cares, since you can enjoy the Falcon-demos with their superior graphics and sound ;-) !

: Also, will the Falcon take a SCSI or an IDE Hard Drive right out of the
: box or do I need an adaptor? Will it hook to a standard SVGA monitor or

: am I stuck with the Atari Special? And finally does it have an Ethernet
: Port on it like the TT machine used to?

Both drive types can be directly used. Sometimes an adaptor cable is needed, but that doesn't cost much. Falcon doesn't use many Atari-only connectors, like ST did: virtually all ports are PC- and/or Mac-compatible.

It does have a local-talk network connector, like TT does. However, you can't use VME cards at least directly.

: Thanks in advance.

You're welcome - to the family of happy & humble (??) Falcon-watchers =)

Tommi

To connect an STf to the tv, you need an extra hardware attachment (I forget what it's called) The STfm comes with the tv modulator, giving one the option of playing animation files, etc on the tv (and recording them on VCR). It suffers from interference, though, and so does not make a very good monitor. Read this group for leads on who might have an SM124 (b/w) or SC1224 (CGA colour) for sale.

908. Various Atari bits for sale.

Newsgroup: comp.sys.atari.st
Date: 1996-01-15 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DL8oKz.n3n@actrix.gen.nz>
Source record: 152898

Slight revision on the stuff I'm trying to get rid of so I can afford some bigger & better stuff :) (Forgot to ad the Vidi!)

ICD-Link (The original). Plug most SCSI devices into your ST with nothing more than this cable. Any device you can disable parity on, will work, (the vast majority of hard-disks). Includes v6.5.5 of the ICD-Link software. $30

Happy-Copier/Discovery Cartridge. Will copy any disk, even the most heavily copy protected ones, so if your disk-drive eats them, it's no longer a problem, as you've got a backup! (The only disks it can't copy are the Space-Ace/Dragons Lair series although I have a theory that will fix this as well, but as I sold my copy of DL, it doesn't worry me anymore :) $25

Spectre-GCR. Includes Macintosh ROMs. v3.0 of the software. v6.0.5 of the Macintosh finder/system software (apparently the most stable version - it's all on the proper install disks as well!) The manuals, and various essential bits of PD/SW software such as Z-Term, Stuffit, Mac-Binary, drivers for "normal" (ST-compatible) printers. $90 (You won't find a deal like this elsewhere, I recommended 4meg of RAM and at least a 15Meg partition, but this thing emulates a Mac-Plus pretty much flawlessly!)

Migraph hand-scanner, as new. 400DPI scanning, plugs into the cartridge port. Includes v1.84 of touchup, as well as all the manuals. This is about the best hand-scanner you can get for the ST, includes scanner, power supply (USA), cartridge interface, touch-up and documentation. Does 100, 200, 300 & 400 DPI, has automatic dithering (3 levels) or "photo" mode. Adjustable sensitivity (light/dark). Works great. $95

Vidi-ST/Vidi-Chrome. Full colour video digitizing on your ST. Supports the STe's extended palette, and with a little patience can get some brilliant results, and if you use Photochrome, you can get your pictures in several thousand colours! Includes Vidi-ST + Cartridge and the Vidi-Chrome colour upgrade software. Even comes with the RCA/RF cable. $20!

Or, I'll send you the whole lot, for a mere $200 (Including shipping)! Shipping is negotiable on all items, but to get it quickly ain't cheap!

So:

ICD-Link $30
Happy Copier $25
Spectre-GCR $90
Migraph Scanner $95
Vidi-ST/Chrome $20

Or the lot: $200 (A saving of over $60 'cos shipping is included :)

909. Vortex ATonce 386 MSTe card died. Help!

Newsgroup: comp.sys.atari.st
Date: 1996-01-15 00:00:00 UTC
From: jws4p@fermi.clas.Virginia.EDU
Message-ID: <DL8r4o.IGz@murdoch.acc.Virginia.EDU>
Source record: 152899

I have a second-hand Vortex ATonce 386sx emulator board for my Mega STe. It is a board with an Intel 386sx, 387, some fast-ram and some other stuff, that plugs into the CPU socket on the MSTe motherboard, and then the original 68000 plugs into a new socket on the emulator board. Most people have never heard of this product, as it is only for the Mega STe and was, AFAIK, sold new only in England and Germany. Anyway, recently when using the emulator I have been having disk access problems which have been getting progressively worse. In IBM mode my computer will now crash with virtually any hard disk or floppy disk operation other than just reading directories or reading small files. Especially write operations. After it crashes, I have to completely reboot the machince before I can use the Vortex emulator again. There is always a "Post-Mortem Dump" RIP log at the crash, but this is complete Greek to me. Worst of all, the Vortex card, after a disk-related crash, will sometimes cause the Mega STe to randomly bomb in Atari mode, or occasionally even refuse to boot ("Your output device is not responding.") until the entire card is removed from the MSTe motherboard and then replaced. Anyway, if anybody out there has one of these rare emulators and knows what might be wrong with it, or where I could get it fixed, please let me know.

Thanks in advance,
John Stanmeyer

This list is available already. I subscribe to the Cubase-users list and have gotten some good tips and helped some people out of their probems.
How to subscribe:

Send an e-mail to majordomo@mcc.ac.uk without a subject and with the text: subscribe cubase-userlist, or: subscribe logic-userlist, and your mail will start coming within a few days at the most. Normally there comes between 5 and 30 mails per day and there are often very interesting things to read about, as well as the possibility to ask questions.
In the cubase-user group, two of the programmers occasionally drop in and answer questions.

Best regards,

Claes

Yes, for applications such as word processors the user interface is a limitation, and putting Windows on it will make anything less than a Pentium feel a little sluggish compared to even an ST. But for processor/memory intensive tasks a modern PC is faster than a TT. And MPEG decompression certainly falls into that category.

I guess your boot HD will be the Seagate? This 48Mb model must be very old now, perhaps it is just getting to the end of its life [sob].

b> I have reseated all the socketed chips in the computer and on the host
b> adapter,
b> and tried various other things in the last few days. Nothing has
b> helped and it seems to be getting worse and it's driving me nuts.
b> HELP!!

Have you re-installed the driver?

Why not re-configure so that you boot off the newer drive. You may have to swap the IDs round. If this improves things then move your least important stuff onto the Seagate and plan to replace it ASAP.

If this seems to be the problem and you get as far as backing up the Seagate you could try reformatting it. This sometimes rejuvenates aging drives by laying down some new tracks.

918. Re: Is FALCON worth buying?

Newsgroup: comp.sys.atari.st
Date: 1996-01-16 00:00:00 UTC
From: dcohen@cix.compulink.co.uk
Message-ID: <DL9EzB.AJ7@cix.compulink.co.uk>
Source record: 152704

Is the Falcon worth buying?

NOT if it is the one recently stolen from me.

To be precise, I was selling it and a guy paid by a building society check (like a US cashier's check, I think) which turned out to be counterfeit.

So, if anyone in the UK is offered a Falcon, please check it out. The hard drive will contain (if he has not deleted the files) much PD and unregistered shareware, but also BlowUp (software version) and the registered version of Selectric, both of which should have my name recorded somewhere (this could be checked without alerting the seller). Serial number (checking this ould probably alert the seller that something was going on) is Y437022003940.

To return to the original question, I liked my Falcon, found it ran ll the serious software I wanted to use (I believe some of the programming languages don't work), but it's sufficiently different that many games won't work (though many do work using the program Backward).

I finally moved to a Mac with MagicMac. Pretty compatible, Macs are in general more likely to crash than Ataris. Much faster, I think. Definitely worth considring, bu I'm sure the decision could go either way.

>on the 68K
>
> yada yada yada

Sorry but you are wrong. Although the two addresses you give are correct, you've overlooked the fact that these reside in ROM not RAM. If these addresses were in RAM, when you turned on your machine these addresses would contain random info and thus be useless. In fact the Initial Stack Pointer on ST's is useless because it contains garbage (or possibly a serial code).

The only way to catch the reset vector is to use the System Reset Bailout Vector ($42a) together with resvalid ($426).

One futher note:

The System Bailout Vector is called before ANY hardware intialiazation. The only thing done before hand is to check for a diagnostics cartridge and set a stack. You will need to completey reset all the hardware (ie video chip, keyboard and the MFP). However all the memory will still be intact so when you've reset the hardware you can return control to your program. I'm not sure about the Memory Controller Byte though, it might be worth your time going through the reset vector with MonST to see what's happening.

See http://www.bath.ac.uk/~py4sdh/htmls/sysvars.html for futher info on system varibles.

Here's one for the experts...

What is the best CAD system for the ST/TT? By best, I mean ability to handle large files with reasonable speed, preferably with DXF in/out capability.

Also, are there any conversion utilities which will convert between HPGL,GEM, DXF etc etc?

Any help would be greatly appreciated...

But as far as I remember the screen saver turns black instead of
inverting (so the screen can still be read) like Maccel 3 does.
I guess that's why I went back to Maccel 3, even though I have
Silkmouse which is much more advanced.

Wouldn't surprise me.

> * long filenames

Neodesk is a Desktop replacement, not a graphical unix shell.

> * non-buggy window redraws

That's was fixed in the latest upgrade.

> * icons that can be bigger than 32x32

Why? :) And at least Neodesk has a built-in editor that can be used
easilly, I've yet to work out the one Thing has (and it's somewhere
behind this application at the moment, as it loads in about a tenth of
the time Neodesk does due to that annoying de-comp routine Neodesk does.

Thing is a very nice product, and if the english v1.00 is any good, I'll
send 'em some money! (Which is saying something considering my
displeasure with all the other Shareware authors I've registered stuff
with, including Dave Munsie who has had ~$20 of mine for about 5 months
now...)

Lattice C v5.6, very nearly (if not) the latest version of the best C
compiler/interpreter for the Atari. As new, not even registered yet, and
it can be yours for a mere $120 (includes postage anywhere on the globe).
It's the English version BTW, and is in original box with all the bits.

Was bought to be used on a Falcon, but he sold it and got a Powermac instead.

I am on the phone right now, speaking to a friend about our old Atari ST's. We were really fond of them but eventually gave up on them for the better supported IBM systems.

Before I made the switch I was writing a BBS Program called Matrix in GFA Basic 3.0. It was (not being modest) a pretty good program. Most of it was written but it was without any file transfer section. I released it as is and got quite a bit of mail from all over the U.S. from people who were using it and improving it.

I haven't heard a thing about it since, I'm wondering if it ever took off in any way? I figured that somebody would use the foundation and work from there, then probably re-name it. It was released in the Summer of 1989.

I would appreciate any leads you may have, old source code, whatever, even if someone is running a version of it someplace, I'd be extatic.

Thanks in advance,

Mike Szewczyk

927. TCP/IP fuer Atari-ST ?

Newsgroup: comp.sys.atari.st

Hi,

I'm looking for a software package that implement the TCP/IP stack
and the slip and/or ppp protocol using the serial port.

I have tried an older version of ka9q ported to the ST but that seems
to have problems with its keyboard input routine.

Regularly, the keyboard input hangs completely and I have to reboot
the machine.

What else does exist and where can I find it?

Look for NOS 0.42 in place of ka9q (ftp.demon.co.uk)

>What else does exist and where can I find it?

STiK does SLIP and is used by the web browser Cab (look for WWW116).
There are also telnet and orc clients available.

Is there anybody who can summerise the differences between Lattice C version 5, and Lattice C version 5.60?

Bug fixes, library code / extensions, that sort of thing. Basically, is V5 worth buying (at how much discount) over V5.6?

Will either compile NOS 0.42?

Thanks

>
>Is this an insurmountable problem?

Not with 133E. I just dug out my resource editor and extended the
length of the email field to 60 characters. I then put in a 60
character dummy email. It got placed in the .TXT and .WRK files
correctly. The header in .TXT looked ok as well so it would probably
post off. You may have a potential crash waiting unless the following
conditions are met.

a) the field is not copied elsewhere internally.
b) it is copied elsewhere internally but the space is allocated
dynamically, which is possible as the field is TEDINFO.
c) it is copied elsewhere internally but this space has been defined
large enough to allow for this, typically because higher resolution
resources are allowed longer fields.

I have had some previous success at changing the default buttons to my
preferences but due to limitations in my resource editor, I ended up
having to re-enter a lot of fields. Amazingly it worked so I wasn't
too surprized to find this did also.

Only time will tell!

Btw, for a one off email, you could just change the .WRK file and the
header information in the .TXT file.

No,... really ?
A stock PC bought through any PC-discounter, just thrown together by some
nitwit, not hampered by any knowledge usually, that's what *I* call a dog.

Besides, you had better take a closer look at PC's; all Pentium systems
are, essentially, just hyper-turbocharged iNTEL 8088's. The internal
architecture is still completely the same. Now that's progress !

What follows is a fairly long story, but I think it is well worth reading :

Cubase on a 4 MB ST runs much more reliable and with *all* features,
including a Score-editor that can compete with the best of them.
It may be of interest that the world's leading(?) manufacturers of
MIDI-sequencers, Steinberg of Cubase, declared they believed that the
Atari 1040 ST has the *best* system-timing and internal design compared
to other computersystems, *bar none !* (not even the Mac is better !).

This only applies, of course, for their _specific_ applications, i.e. MIDI sequencing/recording/editing. And _no_, that was not said in the eighties. Ask any Recording-Studio in the world, they'll probably say the same. Many of my customers have eventually bought PC's for MIDI stuff and some of them have also made the mistake at that point of selling their Ataris. A significant amount of them have come to regret this fact later on...

On a Falcon, Cubase does allow you to record up to 16 tracks direct-to-disk with 16-bit, 48 KHz quality, additionally to the 64 MIDI-tracks. To get the same performance, but way less stable, on a PC you need a 90 MHz Pentium or better, 16 (strongly recommended: 32!) MB RAM, and a fancy Turtle-Beach soundcard costing $500+. About $3500 total, minimum. If you also require an SP-DIF interface, tough luck: they're twice as expensive as they are for the Falcon. No affordable PC Soundcard has *seperate* outputs per channel. The falcon has 8 seperate outputs for an additional $650 or so. And with a PC, chances are, after you've just played the solo of your life, a message in a neatly 3D-shaded light-blue-with-moire-effect Dialogbox on screen says something like:

```

So: an Atari can easily compete with a Pentium 90 in this respect.
For Video, things are looking brighter for the PC (as is the

case for all applications that require massive CPU-Power) The falcon can (barely) compete with that, although APEX did a superb job of pushing the Falc way beyond its limits. Nevertheless, PC's are truely bad, even when it comes to video. Let me quote the german C't here, one of the world's leading computermagazines: "A big problem nowadays lies in the 'Systemwasserkopf' of Windows's origin, especially in 'Video for Windows'. The manufacturers of affordable PC-Motion-Video cards are relying on this platform, but get into huge problems when simultaneous Video- and Audio-files have to be transfered. Amiga-owners amuse themselves over all the posts of their PC-colleagues, because this computer-system that over the years has become obsolete, provided a much better platform than Video for Windows does." [end quote](translated into english by me) [C't - Magazin fuer Computer Technik, December '95, page 166]

True, I was never an Amiga-adept myself... Still, it holds true that a system, very comparable to Ataris in processing-power, still kinda beats the shit out of Pentiums in this age. Ask any local small low-budget TV-station, they'll say the same thing: a 30 times less powerfull system still beats, (I just _have_ to say it again, it has a nice ring to it >:-> *the shit out of a PCI-Pentium* anyday.

And that holds true for more things. Calamus is way better than MS-Word or Pagemaker, Cranach Prevision can keep up with most Image-manipulation packages. Also, I can perfectly use one program to read both Mail and News offline very comfortably, whereas most PC-users use (Free-)Agent for News and Eudora for Mail. Hey, a PC is so great, was it too difficult to make just one program that does it all, huh ? On the other hand, talking about the Internet, PC-owners have Netscape, a program that is clearly leaps and bonds ahead of the WWW116-package. But, alas, the built-in newsreader of Netscape, Mozilla, has got to be classified as the biggest mistake *ever* any programmer could possibly have made. What use is it to build something in that is so buggy it posts every message at least four times ?
In an otherwise superb program, no less...

Let's talk about operating systems, then. Don't come harass me with stories about how bad GEM/TOS is, modern people use MagiC. I, in return, will not start whining about DOS. No, Windows is the real thing to have nowadays, so let's concentrate on that. Luckily I own Windows95 now, I believe I no longer have to rely on other people's rumours. First: it's Great. Fairly stable, and incredibly but true, it even (kinda) works with only 4 MB RAM. Believe it or not. Of course it's as slow as a melted videotape in that case, but it nevertheless works. Okay. Good. Only, I really dislike the user-interface, and then to hear that all my friends said it resembled Ataris desktop now _more than ever_. Blah. The whole world put the close-button of a window in the leftmost top, so what does M$ do? Exactly, they put it in the _right_, err...no, righthand ;) corner. Innovative, huh ? Or, alternatively, you can still close a window in the left corner but then you have to double-click. No problem, I can do that, I just don't _want_ to when it comes to dead-basic things like closing a simple $^&*@ window. Jeez.

What is worse is that you tend to get more and more files in the Windows directories without any apparent reason. DLLs, INIs and whatnot. And in true M$ fashion, now that they *have* long filenames those names are..... still totally incomprehensible. I mean, A program f*cks up during installation and adds/removes/replaces/moves/alters some of the systemfiles. I'd like to see anyone fix that fast enough for someone to afford it at the steep rates of $45 - $70 per hour PC repairmen usually charge. Myself included, that is correct ;-\

But now, over to the strong (ahem) point of W95 :
Plug and Play. Well I am trying, to this day, to get my SCSI card working, as well as my friend's scanner. Nope. No deal. Nothing. It *did* find my videocard, my RAM, my CPU (yes!) and my CD-Rom player, but I have no use for an OS that does only 65% of what it promised.
Plug and Auto-Eject, more like. Sure, it's only the first release. Let's wait awhile longer. Things will get better. And bigger. And slower.
Trouble is, if some guys in Germany can write an OS that's almost as good as Windows95 and a great deal more stable, and some guys in Canada can provide me with a truely great GUI I can run on top of it, why can't Microsoft, a company with 10.000 times as many resources, in all respects, not make a stable, optimized, better Operating System in, say, three months ? It beats me. For now, about the only thing M$ is good at is marketing.

The strong points of MagiC / Neodesk4 : It has, unlike W95, preemptive multitasking for *all* programs. It is *so* compatible only one (1) of my programs has to be started is single-mode. And I use hundreds of programs. That's what *I* call downwards compatible, yes sir.
(admittedly I had thrown out all programs that didn't support 1024*768 resolutions at an earlier stage already, so the above statement is somewhat easier for me to say than for probably many other Atari users, but...)
It runs incredibly stable on my upgraded ST with an 68000/28MHz in it, even though this processor is as suited for true multitasking as the 80286 was.
My OS, all put together, (so including NVDI, all patches, essential accessories & tools and the like) barely takes more than some 10 MB on my harddisk. That's what I call a compact, fully equipped, fully functional OS. Some people may already be amazed by this amount, but I'm counting fax-, network-, videocard-, harddisk-, acceleratorcard- software too, everything. Otherwise it wouldn't be very fair to compare it with Windows, right ?
My system bombs out on me (not my programs, that happens somewhat more often, but the kernel itself i.e. the whole system) about 5-6 times a month. (There is one exeption: when I have to _demonstrate_ something it hangs all the time but that's not fair, that's just Murphy's Law in action 8;-))
My guess is that 4 of those resets would be necessary anyhow due to keeping memory fragmentation low, but that's not very relevant right now.
It is used 10-14 hours a day and never powered down exept for modifications.
Not stable at all by any _real_ standards (like any Unix is) but okay for me.
I'd challenge any Dos/Windows3/Windows95 setup to come up with better results.

A thing strikes me as very arrogant and stupid is that the PC world keeps on forcing 'standards' upon us all. And Bad standards. Starting with, of course: The PC itself, obviously. And on we go: why must Netscape define an own 'standard' for WWW pages ? Why does Eudora use Binhex as default, when the

rest of the world already has a perfectly good standard, MIME ? Why does the world have (E)IDE when we had SCSI ? Why AVI, MPEG was alright. Why BMP, GIF and JPEG and TIFF were already good standards. Why different Fonttypes, what was wrong with PostScript, why can't I just drag an icon onto the Windows95 desktop but must make it a symbolic link instead ? Me thinks Neodesk had that one figured out in '89 already, putting icons onto desktops without further ado... What do we need Windows-printers for, it worked too before, didn't it ? Why connecting harddisks though the slow printerport, ever heard of SCSI ? In fact, Why did we get stuck with Dos in the first place when Unix was around for years...?

But 'new' standards aren't *that* bad. THIS is worse; total lack of- :
Why do some 7 different soundcards exist with very much more powerful DSPs in them than the MC56001, yet no-one can use them because they are not compatible to anthing but themselves (and the free demosoftware delivered with them) ? Whoever invented the AT-Bus-type CD-Roms with their generic adapters, one still less compatible than the next one ? Why does iNTEL make 'compatible' "Pentium-Overdrive" processors meant to replace the old 486 you use, yet you _still_ need a new motherboard for it, to use all its power ? Downward compatibility they dare to call that. Not keeping promises I call it.
All in all, What use is a system that's directly crippled by the unability to use all that power ? (Can you imagine a Lamborghini with a speedlimiter of 90 Km/h built-in ?)

Or can you imagine what nightmare it is for a computer-repairman like I am, to open up, say, 127 PC's in a timespan of a few months and not find even TWO motherboards that are the same ? With the same chips (that would enable me to actually try and *repair* it, instead of discarding it and fitting a brand-new one. Would be nice for the environment too.) or the same (more or less standardized) placement for jumpers, or the _exact_ same place for _screwholes_, ferchrissakes ! Jeeez, these are the nineties, we have committees and organisations for almost everything and real high-tech measuring-equipment able to actually _count_, one by one, the molecules in a lump of sugar, but we can't standardize *this* ? Come on, get real.

Well, sorry for this above story, I got a bit carried away I guess...:)

Anyways, there is a bright side to all this too. If Microsoft and all other manufacturers had had their stuff sorted out, Ataris would have been _real_ obsolete by now. The lack of standards is good for other smaller brands.
But it just keeps hitting me how perfectly accurate it seems to work:
New mediocre standards are being made where we already had good ones, and *no* standards are made where we really desperately could use them...
Almost as if someone _wants_ it to be this way... Bill ? Hellooo ?
Oh Well...

Maarten (c) 1996 maberg

I can confirm there are some pages which definately fail consistently
at the same point (bus error and termination under MagiC 2.0). I will
make a note of them in future.

Don't use 1.44 meg disks for a start, read this: ;-)

The ST to PC disk-dilemma FAQ
(Or - "How do I read my Atari disks on my DOS machine?")

v0.9

By Steve Wells - steve_w@atlantis.actrix.gen.nz

This FAQ attempts to explain, how you can make the data on your Atari-ST (or compatible) diskettes, readable by a PC, or indeed, and machine that is capable of reading PC disks (More modern Mac's, Unix boxes etc.). I've tried to explain all problems involved, but this FAQ still has some holes in it, and some information may just be plain wrong. I'd appreciate any extra information, and constructive criticism and corrections are welcomed.

The simplest way to make a disk accessable by both the ST and the MS-DOS machine, is to format a 720Kb disk on the PC. This is done by taking a 720Kb disk, or a High-Density one and sticking tape over the HD-detect hole (which is the one without the sliding bit behind it), as many PC's refuse to format HD disks in 720Kb mode. Just use a disk you'd normally find on your ST, and you'll be fine (although, with PC's unfortunately becoming the "standard", 720Kb disks are getting harder to find, so, although this trick is considered by many to be a bit dodgy, due to some of the differences between the makeup of the DD and HD disks, it's becoming the only way. Most people don't have any problems using HD disks as DD ones, but some drives don't generate enough electrical-charge to work with the HD disks, which may prevent them from working properly with them. Judging from the relatively small number of complaints about this though, these drives are pretty rare, (probably only quite old ones)).

Put the disk into the PC.

Type

FORMAT A: /F:720

This will format the disk to 9-sectors per track, 80-tracks (00-79), and 2-sides. Giving you near enough 720Kb.

This disk will now be readable on both PC's and ST's.

Or, you can format a disk on the ST. If you have at least TOS 1.4 installed, (later model Mega-ST's, and any machine from an STE upwards), then the computer will format disks to be PC-readable. Machines before this use a slightly different method which most PC's don't understand.

Note: Maybe 1% of ST's out there still have single-sided drives, so if the ST you are going to be using does, then make sure you format disks single-sided. Do do this on the PC requires: FORMAT A: /S:1 /F:360 but as no-one in their right mind ever uses this - I'm not 100% sure of this command.

All you have to do for this, is put a blank disk in the drive, an select "Format Disk" from the "Desk" menu. Select "Double Sided" and "OK". Now wait. Not _all_ PC's will read disks formatted this way, the only way to find out if yours will is to try. Probably the simplest way is to track down "DC-Format" by Double Click software, which is available on most of the major Atari supporting FTP sites. The filename to look for should be DCFMT30.ARC. On atari.archive.umich.edu it's in atari/Utilities/Dc/ and on ftp.cnam.fr it's in pub/atari/Utilities/Dc/. It should be on most other archives in the utilities directory.

To format a PC disk with this program requires the settings to be:

Sides: 2 Format Type: Normal # of Tracks: 80
Sectors Per Track: 9

Most PC's won't read disks with "Skewed" or "Twisted" sector formats, so don't format them with this option unless you know your machine will read them - the PC's I've tried this with work _slower_ with this format anyway, other than the ~50% increase obtained by using it on the ST.

Format the disk with these options, then select "MS-DOS Bootsector", and write a DOS compatible bootsector to the disk.

This way almost never fails. But those PC's are fussy machines, so it's usually best to use the first method and just format the disk on the PC it's going to be read by.

---------- Converting the data

You hardly need to touch most of it. GIF's are viewable by pretty much any viewer on the PC (CShow) and ST (Speed of lite). MOD Files aren't - there's about 10 different "standard" for MOD files now, and only a couple of them are usable on the ST. Scream-Tracker files, MED files, most Octalyser files and others, just aren't supported on the ST. Although, there are programs for the Falcon-030 that will play many of

the new formats.

Text files are used by the same format. Just make sure you save your files out "As ASCII" or you'll have to work around conversion patterns. A well supported method is to save your files as .RTF (Richtext Format), which is loadable on most PC (Windows) word-processors, and a few on the ST. There are also convertors on the ST to change many PC formats into ones readble on the ST. Other platforms (Mac, Unix etc.) do use slightly different methods, so you may have to dig up a conversion utility to keep them happy - look for "Blinex" for the ST which will do this for you.)

So, in a nutshell, the simplest way to transfer data using 3.5-inch diskettes, is to format it on the PC, and from there anything on it can be read by either machine.

Notes:

o Some DD drives (very rare) will not generate sufficient electrical charge to work 100% with HD (1.44Meg+) disks. If you find using HD disks on your ST results in lots of disk errors, try cleaning the drive heads (cleaning disks can be obtained from virtually any computer store), and if still they cause trouble, you may want to try and locate some standard DD (720Kb) disks.

o There are some combinations of platforms and formats that will render text files incomprehensible. There are programs for all platforms that will deal with the vast majority of such problems. The best one I have seen for the ST is "Blinex" which will strip "illegal" characters from text files, and write them in their correct ST-compatible text formats. It will also write files in PC/Mac/Unix formats. It also has some other handy functions which make Blinex an invaluable tool if you do a lot of text-file manipulation. Blinex should be available at all good Atari supporting FTP sites in the Printing or Utility directories.

o Some early Atari machines, and extremely rare more recent ones, have problems with their disk-detect mechanism. This can result in the computer not realising that the disk has been changed. The problem with this and PC disks is that, most versions of MS-DOS write the same serial number to the disks, and the serial number is what TOS uses to see if the current disk is the same as the previously accessed one or not. If the serial numbers of 2 disks are the same, and the drive doesn't notice they've been changed, then TOS will often happily continue thinking that the new disk is the exact same disk as the first one. This can result in corrupted data, lost files, and ruined disks.

There are a couple of ways to fix this problem. The most obvious, but least practical, is to get a newer disk-drive without this problem. Another, is to find a program called "FMC" (Force Media Change), which forces TOS to do a complete re-read of all FAT and directory information when a new disk is inserted, this reduces, but not removes the problem.

Lastly, the best method, is to format disks to be PC compatible without actually writing a PC-specific boot sector to them. There are several programs that do this. M-Disk is one such program, and most decent formatters will also manage this task. This means simply that the bootsector will contain an original serial number, rather than one that translates to "3.3" (MS-DOS v3.3) or some such thing. There are also programs available that will randomly select, and write a new serial number to the disk. "V-Killer" (A Virus Killer) will enable you to change this, and there are many other programs that will also manage this.

These programs were all found in atari/Diskutils/ on atari.archive.umich.edu or one of its mirrors, or the easier to get into ftp.cnam.fr (pub/atari/Diskutils)

Useful programs:

SERIAL.ZOO Randomly allocates a serial number to the disk, DOS doesn't really care, but it saves your ST some confusion.
UNEEKIT.ZOO Similar to the above.
PCFORMAT.LZH As it says, a program specifically to format disks on your Atari that will be readable by a PC.

MS-DOS Programs:

ST2DOS10.ZIP Will modify some disks to make them readable on the PC.
ATARIDSK.ZIP Will let a PC read disks formatted using TOS 1.2.0

o Even with everything done correctly. Some PC's may still not read your disks. This will most likely be caused by one, or both of the machines having mis-aligned drive heads. An often effective solution is to simply clean the heads using a "cleaning disk" you should be able to get from most computer or stationary stores. If this still doesn't work, then you may have to get the heads on your disk-drive re-aligned. This is a routine that goes beyond the realms of the FAQ, and should really be consigned to someone who knows how to do it - if done incorrectly, it _can_ wreck your drive, or at least, worsen the compatibility. If done correctly, it can make disks more reliable, and often speed things up. At least try and clean your drive heads every couple of months, or more often if you use them a lot!

ADDENDUM: Some PC's will flat refuse to format a disk to 720K if it is a HD (1.44meg) disk. This can be solved just by sticking some tape over the HD hole on the disk so that the detection-pin in the drive thinks it's a 720K disk. (Some drives use light-sensors, so you may need insulation tape or something the light can't penetrate in this case.)

It's been reliable for so long because once things are set up right they
don't tend to go wrong. FTN software won't either once it's set up right -
there's just so many variables it's very easy for things to go wrong when
setting it up.

Thanks for finding it! I have converted virtually all of it (as best I
can) into English. This was achieved by using a disk-editor so for
instance Noir -> Blck. If anyone knows a way to edit it properly I would
be grateful.

Some bits of text don't seem to be in the program although they are in
the file, anyway here are some parts I am unsure of:
Taille de la page
Utilisation de l'encre
Papier couche (acute acent on the last e) - Plain paper?
Logiciel (next to A4... in the paper settings)
Trame img/vec - bitmap/vector graphics?
Aucune - in the above settings - next to "Demi ton .." which means half-tone

How did you get it to work with NVDI 3? I have 3.01 and although I can
install the driver as device 23 in the ASSIGN.SYS file, and access it
through the NVDI-printer configuration CPX, the printer name stays at
Epson... and none of the other settings work either. What version of
NVDI are you using, what is inyour ASSIGN.SYS.

NB: I installed it whilst running NVDI 2.51 (no GDOS). Could this be the
problem?

I can understand them not supplying software for every platform
available, there aren't enough users for it to be worthwhile. I do
object to them not including info in the manuals. They've never been
good, I mean one line per code was all you ever got. but at least it
was enough to get you started. Now you can't do anything without
paying for a technical manual.

I wouldn't buy anything that doesn't come with decent technical
documentation included.

There's a PD system, I don't know how good it is.

Stefan Lindner and Christoph Strunk have both released shareware versions, which were complete kits with GEM shells. Lindner's had a much nicer shell and previewer, but doesn't work on the Falcon (at least, I couldn't get it to) and doesn't include a "big TeX" program needed for some LaTeX files.

A german magazine mentioned something called MultiTeX apparently also by Lindner, it appeared to be a really nice system with a GEM based previewer, but I'm not sure what the distribution conditions were and I've never seen it in a UK mag or found it on an ftp site.

Hi Phil,

Try CKBD1.3 (ftp.cnam.fr). Very good keyboard mapping (if you need it) and the
best mouse accelerator I have used. For me it is better than silkmouse, which
I found interfered with some programs and caused crashes on occasion.

If you want it, email me and I will send it for you.

You could try diamond edge (dade) or discus (the best) and rename the garbage
entries to sensible ones, but whenever I have had that sort of corruption it
has been a 'reformat and start again' problem. Good luck...

I tried ghostlink and had problems. You could try UUEncoding into bite-size
lumps (or just split a big UUE file with a text editor), transfer on floppy,
reassemble on the other machine and then UUDecode. Works for me.

948. Mega STE / Hard Disk Problems

Newsgroup: comp.sys.atari.st
Date: 1996-01-16 00:00:00 UTC
From: bbeck@lilfort.mlnet.com
Message-ID: <N7L8B3D@lilfort.mlnet.com>
Source record: 152734

I have a problem when I boot from a hard drive with my MegaSTE. Sometimes when I boot and the desktop or my boot selector appear they will only show a few different files or folders but there will be 10-15 of each. 10-15 CPX folders, 10-15 AUTO folders, 10-15 NEWDESK.INF files, etc. Sometimes I will have to reboot 10 or so times before I can use the computer. I do not have this problem if I boot from a floppy with the driver in the auto folder.

If I check the FAT's when I boot from the hard disk they are all corrupted, but if I reboot from a floppy and check them they are OK. The driver on the hard disk seems to get corrupted fairly often too. Sometimes it will show up as IcDBOOT.SYS (with the small c) in the desktop directory window.

My setup is a MegaSTE, 4 megs ram, TOS 2.05, AdSCSI ST host adapter, 48 meg Seagate and 105 meg Quantum hard drives.

I have reseated all the socketed chips in the computer and on the host adapter, and tried various other things in the last few days. Nothing has helped and it seems to be getting worse and it's driving me nuts. HELP!!

Brad

I would beg to differ. An 8MB Falcon with Screenblaster, a monitor and a decent-sized hard drive costs far more than a Pentium with a similar specification.

>Plus How much will the new software be to replace all your old faves?
>Do you really want to support Bill Gates and his crappy programming

With that kind of logic, it's a wonder you're not still using a Mattel Aquarius.

>If you have a lot of software and like Ataris, with the 2nd hand prices of
>falcons at the moment it's no contest.

You mean you can get second-hand Falcons but not second-hand Pentiums? Gee, I wonder why.

I had a lot of ST software and I like Ataris, but the price difference was too huge to ignore. My Escom Pentium even came with a whole stack of software pre-loaded, although I wiped it almost immediately so I could install Windows and Linux (dual-boot). After downloading Netscape Navigator, Free Agent and a few other bits and bobs, I had an ideal setup. I got around the problem of not being able to run my favourite ST software any more by.. keeping my STE, although to be honest, the dust cover hasn't been taken off it in about three months.

I would say that unless you have something in particular you need a Falcon for (like Cubase Audio or Apex Media), you'd be well advised to consider a PC instead. Not that this type of advice is likely to go down very well in an Atari newsgroup.

I think your best bet is to download a rather nifty little utility called CKBD. It lets you load in an English keymap so your keyboard will behave just as a QWERTY keyboard.

CKBD also has a mouse accelerator (better than Maccel), an option to 'compose characters' (useful for getting umlauts and so on) and one or two other nifty tricks up it's sleeve.

Hi,

Has anyone a working terminfo file for the virtual consoles
for mint (/usr/lib/terminfo/s/stv52 and stv52c)?
I'd like to have one to use lynx.
The one that was supplied with lynx seems to be broken.

Regards,
Pim Borst.

Quite right actually. It takes some doing to locate the USA phone number to coonect with the HP Printer Development Group, but you CAN get also the Development Users Reference Manuals for the 600 & 850 series printers. I have done it myself.

Because of this I have found that these newer HP printers have the PCL implementation done in firmware. The reason for this is for platform independence. Meaning any computer system can use these printers and achieve the advertised resolutions. Since the basis for these printers has been established since the original development of the DeskJet 500, then all print drivers (based on the 500) will also drive the 600/660/850/855 printers with no changes necessary. Since the color resolutions for the 500c has remained the same through 600/660/850 and 855, 300 dpi, then again - drivers for the 500c/550 and upwards will also correctly drive these 600/660/850/855 printers.

The only difference with the newest 850 series is that HP finally used a different processor CPU to improve the page printing throughput speed. That's the only significant difference. (From the 500 thru the 600 series printers, the host processor has always been the Z80. Neat, huh?)

Date: 1996-01-16 00:00:00 UTC
From: 100422.651@compuserve.com
Message-ID: <4dg3m9$med@dub-news-svc-1.compuserve.com>
Source record: 152741

Hi,

Question time... ;-)

The title says it all: who has tried this combination? Any compatibility problems to report?

For that matter, I'd be interested to know if there are other combinations (eg Magic4+FX) that work or don't work...

Oh, and while I'm at it: how does Magic4 handle graphics cards?

The reason for all this is that I'm planning to buy Magic4 soon and I would like to know if it will prevent me from upgrading my Falcon in any way in the future.

TIA,

Michel

956. Long e-mail addresses w/Oasis

Newsgroup: comp.sys.atari.st
Date: 1996-01-16 00:00:00 UTC
From: andrew@ajrose.demon.co.uk
Message-ID: <821878306_OASIS_@ajrose.demon.co.uk>
Source record: 152742

While trying to test my workplace e-mail implementation I ran into a problem with OASIS - the e-mail address given at work is simply too long for OASIS to cope with.

If you try to add it to Yellow Pages it gets cut off at the end.

If you try to reply the same happens and the mail gets returned.

Is this an insurmountable problem?

Andrew

Because local BBS's still offer the user info and news and other things from the stand point of the local area, just what the internets does NOT do at all. I am a sysop, and I have users who do not have any kind of internets accounts, so that means it's 100% useless to them [internets that is]. I only have access to the newsgroups because a LOCAL BBS has them gated to it.

Don't know if you remember my BBS being a part of the network. I was
running The Meeting Place in Baltimore. My 3rd power supply in 2 years to
my ST died and I got tired of buying a new one, so my BBS went down.
Rich was firm on not making Express compatible with the Falcon and I have
no intentions of starting from scratch.

If it was making clicking noises and perhaps causing ever more
frequent resets (by intermittent power down) try running a soldering
iron over the underside - dry joints are quite common.

It cetainly should be! I don't know the backup software but maybe it has
to be configured by telling it the IDs of the connected HDs. Diamond Back
does not need this as it scans for devices itself but maybe yours needs
telling :)

I would also like to know the e-mail address of ICD.

>
It depends on what bench marks you are running I'd say.

A bench mark for the whole system performance could give better results
on a dx66 than a dx100/pentium if he had a top grade motherboard and the
100/pentium had standard mother boards, and a faster HD and gfx card etc.

Most people don't seem to realize how important your PC's subsystems
really are to overall performance.

Of course if the bench mark was purely (sp?)based on CPU power then the
results are suspect. The only way a dx66 could be faster than a dx100
would be if the dx100 had slower memory or a smaller instruction/data
cache.

As an aside;

Does any one know anything about EDO ram and pipeline burst mode caches?

I was looking to buy a PC this X-Mas, and found these new catch phrases
floating around. The manufactures who are selling machines with these
dodahs claim around a 25% system performance increase...

Also I got a p120 would I need a 64-bit gfx with 2 Vram to keep pace? or
would the cheaper Dram version be fast enough.

975. ISIS dieing

Newsgroup: comp.sys.atari.st
Date: 1996-01-16 00:00:00 UTC
From: slc.dennis.bishop@muskrat.com
Message-ID: <9601160217437826@muskrat.com>
Source record: 152826

I have a BBS in Waianae,Hi. For the last few years I've been a Node of the ISIS network, at 1st it was for the Online game Space Empire Elite, then there came the Express Networked message bases, and for awhile they where trying to figure out how to gate Fidonet into ISIS. Then came CBase a set of message bases that where hooked into whatever BBS program you used.{I use BBS Express ST].

The Fido gateway never did get done, the Express message bases dried up as it just took so long for the messages to be imported into the bases and the writer has left Atari anyway from what I understand.

The writer of CBase also left, but it was turned over to another person who has control of it. I used to have CBase on my BBS, but after I would not walk a fine line and agree with the other far 'RIGHT' and far 'Rel.Right' sysop, and my users who did NOT agree with them and would say so, my BBS was removed by the Sysop of Node 56 who now runs Cbase.

The S.E.E. game has gone from 12 or more BBS's playing it to just 3 boards now.

There are only 2 Atari BBS's over here, my Black Hole BBS, and Ace-Hi BBS the Atari User Group. They do not want to network at all, I've tried to get them in a net, but no way.

As my income comes from a fixed disabitly I do not have the funds for a lot of calls to the mainland, I've asked on the local Fidonet board for help without anyone taking me up on it. [guess they don't like Atari boards]. I've asked here, without anything coming back.

That notice about the Atari network, sounded real nice, but it looks like that it'll never reach Hawaii and the Atari Users over here.

So until the day that I can figure out this semper with it's clear as mud docs, I'll be on the slowy dieing ISIS Network.

Black Hole BBS ISIS #11 808-696-7763 300-14.4kb 24hrs.
Supporting Astronomy, Japanese Anime, Babylon 5, Atari Computers.

... Hooked my car battery backwards. Now my horn sucks.

Message-ID: <1996Jan16.005235.22832@freenet.victoria.bc.ca>
Source record: 152829

I have an ICD FAST 50 MEG harddrive and tape backup. The 50 megs is divided into a 5 - meg boot partition and 3 - 15 meg partitions. This is connected to a Mega 4 STe which has a 150 meg hardrive divided into 3 - 50 meg partitions. The tape backup does the 5 - meg boot partition and 3 - 15 meg partitions with no problem but does not seem to recognize the partitions in the Mega 4. I bought the ICD unit used and only have a manual for the tape backup, not the harddrive. Does anyone know how if it is possible to get the tape backup unit to backup the other harddrive? I would also like to know the e-mail address of ICD. Thanks ... Gord

Yes, that's the same thing I would be doing as I just know the very
basics of the program. Aren't there any experienced users out there?
Then again i guess experienced Notator/Creator people wouldn't bother
to get on a mailing list answering stupid questions.

Exactly what errors do you get then?

On what computer was this? I couldn't get it to work on the Falcon, on the ST it worked almost "out of the box", just had to change the one configuration file and that was only because I wanted to move some files about.

I must say I found Lindner's TeX much nicer than Strunk's (well, the shell and the previewer, which are the only user visible parts), but you might have to use Strunk's if you can't get the other to work - with a bit of work you can use Lindner's previewer, but possibly not his shell, I don't know.

:
: If you are in the market for a new Atari then a Falcon makes good sense.
: It really depends what you want to do. The TT is a more 'professional'
: machine - but doesn't have as good graphics/sound - despite being a bit
: faster.

An accelerated Falcon is actually faster than a TT. Even FX-Card (pretty cheap) can achieve this. Falcon OS is faster than TT's TOS 3.0x in many aspects, especially in graphics. I'd say that a TT without TT-RAM is about as fast as a Falcon, generally. A FX-accelerated Falcon with Fast RAM again matches well a TT with TT-RAM. I've used all of these Ataris a lot, so I know it well enough..

Falcon's TOS 4 is so much better IMHO than TOS 3 that I wouldn't choose a TT, unless for special purposes. You can also accelerate a Falcon with a 68040, which you can't currently (if ever?) do to a TT.

Cheers,
Tommi

You need Ghostlink. Hook the null cable between the two.
There are two programs with Ghostlink. STMaster and pcslave
(sounds about right). Start pcslave from dos and configure
the speed and port. Start StMaster from your Atari, configure
the port, speed and drive letter and install. Do an install
devices from the desk top and the drive letter you assigned will
apear. Click it on and you will see all the drives available on
the pc. Drag and Drop as usual.

OK, you need to run your init program. This init program (along with getty)
will give you the normal login: prompt you see in real unix box. Normally,
multitos is setup to run the AES 4.0 desktop. So you need to setup the init
program instead of the AES desktop. I have 2 mint.cnf file, one for the AES
desktop and the other for the init program (I normally use this).

In your MINT.CNF file, locate the "INIT=" field, should be the last line of
the file. I guess your's should look like
INIT=C:\MULTITOS\GEM.SYS
Change this to
INIT=u:\usr\sbin\init
Note that my setup is such that init program is in u:\usr\sbin. You should
change it to your path for the init.

Note that init program will need to have the rc script setup correctly,
sometimes it will core dump if not setup correctly.

HTH

First things first, do you have HSMODEM installed (correctly)? There
is DRVIN.PRG and MFP.PRG. You must run a special setup program which
writes directly into one of the executables.

I've just had a look, Cab uses 440Kb just to boot on my system. I
dunno about StiK 'cos I've given a huge buffer. You could be running
short on memory. Somebody else will know better.

No, but I installed it on a SPARCstation Ultra machine (300SPECfp,
200 SPECint), and it plays frontier about as fast as an ST. I'm used
to a Falcon now, so I was a little disappointed.

I think there must be a limit somewhere, because there's no way the
Ultra is 15x the speed of my SPARCstation IPX at home, which it would
be if the SPECmarks were scaleable.

Ps: a 320x200 window looks amazingly small on a 1600x1280 screen :-)
It might be nice to be able to zoom pixels (so each pixel is (say) 2x2
or 4x4 rather than a 1:1 ratio)

It's an amazing piece of software though. I haven't tried running
any 'serious' software on it using the VDI yet - I'll have a go soon
though :-)

ATB,
Simon.

Yes, it's there. I've been working on some new links for my web page
and found the HP660 as well as the 550C drivers there:

<LI>hp660c.zip
<LI>hp550c.zip

Does indigo have an email address? I haven't received any catalogue
from them for ages.. the last one I have is no. 10 (April '95).

The version I got was for an American system, but I found a UK version
somewhere else (sorry, I can't remember where, but it was before I got
any kind of net access so probably from a PD library)

ISTR whoever did the mod had used a sector editor.

>I'm also wondering how the shell could be installed within my system,
>so that it can be called upon from other programs- I see that in some
>menues there's a "start shell". Do I set this in the "environment"

Probably. I've never tried it though.

>Finally, how do I add more commands to it? I miss several commands,
>like "more" (yes, I know Uemacs replaces this for now, but I'd like a
>plain "more" instead), "less", "tail" and a few others. Are these

tcsh doesn't have any of those commands either, in fact it has
significantly less than gulam. On a unix system they are all external
programs which live in either /bin or /usr/bin.

Ports of the relevant unix programs are available, although a handful
require MiNT. Put them somewhere, add it to your path (and rehash if you
want to use them in the current gulam session).

>Ghostlink transfers both ways with no problems....

>I just wish he had released the parallel port version

Yeah, I ftp'd the GhostLink and it's great.. too bad the highest
possible baudrate is only 19200 on my 520STFM. At least I don't need
to copy disk-image files in 300kb pieces. Thanks guys, you saved my
life (copying about 500MB of compressed files using "temporary files"
would have killed me).

1000. cab/stik: a new repeatable bug??

Newsgroup: comp.sys.atari.st
Date: 1996-01-16 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4dfauk$j98@madeline.INS.CWRU.Edu>
Source record: 152851

I seem to have found a new, repeatable bug, at least for me.
I call http://www.nbc.com, which comes up fine.
I then click on "news" at the top, OR on daily news in the menu.
It faithfully loads about 22000 bytes and CAB disappears,
leaving me back at the desktop! I can reload cab, and it gives
me almost anything else I want to retrieve. But try to get
nbc news, and it crashes again. I have thought I have seen this
before, (mostly while trying to access PENTHOUSE) but not been
able to establish definitively where and when.
I have a 1040stf with 4 Meg, and a 16MHz ADSpeed.
I have been able to get the same page on my (excuse) PC
at the lab, using netscape, so its really CAB/STIK's fault.
Can anyone else reproduce this? A documentable repeatable bug
often helps in identifying a problem.
The C/S system is very stable on my ST. other than
an occasional death which now seems to be related to the
NBC syndrome. Telnet and forecast both function well.

Yep. Just format the disks to PC 720K and use them. Newer Atari's do
this anyway but there are plenty of programs to do it - does the Mac?

I can speak for the CS version. I use it all the time, including for letters
and faxes, lectures etc etc. I think it is very good and wouldn't swap it but
it's horses fer courses... Works well under Magic (Geneva doesn't like the way
it calls it's TTP files and they don't display in windows properly).
Recommend it.

I use this version (CS TeX 4.1) every day for scientific
articles reading and writing and think it's the better.
But the tex & initex programs are both GCC1.4 compiled,
anyone knows if it exists versions compiled with an earlier
version of GCC ?
I think the improvement in speed would be noticeable...

Bruno.

Eh?

What does Unix have to do with it? Long filenames are available to
users of MagiC, MiNT etc. As I can have files with names of better than
8.3 on my system, I need a desktop that can manipulate these files.

|> an Atari newsgroup.

IMO, the main difference between these machines is quality of programms.

I had to work sometimes with MS Word and I found that Papyrus Gold was really far
better than MS-W. I'm sure that Word can do almost everything (just looking at the
space it requires on a HD) but I was really more impressed by PG because it's so
simple to use and, in fact, I never had the impression that an important option
is missing.
I never had the chance to compare Calamus SL and NT or Phase IV and
3D Studio but I think that even old TOS (Magic is surely far better) is a good OS
compared to any Windows version (I really hate this environment) and this is why
I'll always prefer Atari's world to PC's one.

To talk about Falcon, I would say that mine is accelerated and gives me
real satisfaction (except for Multitos with is too slow but Magic or Multitos 2
are really a good deal if I trust what I read in magazines) so I think that Apex,
Cubase Audio, Zero X, Neon 3D, Chloe and many DSP programms (such as Vision,
Studio Photo) are excellent reasons to choose a Falcon rather than a Pentium but
this is a matter of taste.

Hope I'm not barging in... Different strokes fer different folks ain't it? I think Ease is the best for me and I also own Neodesk, which I don't use any more. OTOH I have seen Ease slagged off in this group. For me, long filenames don't represent a benefit so I am not tempted. I do think though that Ease is a far more polished product than any of the other desktop replacements I have seen (and I have seen most of them).

The one thing I regret is that Gemini has not been upgraded since 1.999, I think it would have been a worldbeater but my German I couldn't cope... :-)

I recently bought Magic4. Reading the manual I found out that you should be careful running floppy and harddisk access in background. However I found the manual rather confusing concerning this. I'm using a Mega2 upgraded to 4Mbyte with Bitz harddisks (These are ICD harddisks with a built in interface). How can I found out in an easy non destructive way if background operation is safe with this setup? How can I found out if my blitter has an error as they mention it ?

|
|I would beg to differ. An 8MB Falcon with Screenblaster, a monitor and a
|decent-sized hard drive costs far more than a Pentium with a similar
|specification.
Actually, it's the base falcon that would cost more if anything.
All other components would be of equal cost regardless of
which system they were going into. HOWEVER, the Atari's have
MUCH smaller resource footprints than winclones. An atari
would have similar functionality with 1/4 the RAM and 1/10
the disk space.
|
||Plus How much will the new software be to replace all your old faves?
||Do you really want to support Bill Gates and his crappy programming
||which saps the strength of the Pentiums power?
|
|With that kind of logic, it's a wonder you're not still using a Mattel
|Aquarius.
Well, if it lets you get what to need to do done, then there
really isnt any reason to upgrade that either.

The new Win95 upgrades add little if any functionality,
and do little more than line the pockets of software vendors.

If all one really needs is a tugboat, it is foolish to spring for
a full deck aircraft carrier...

Get yourself the WWW116.ZIP file. This includes several files: CAB and Stik (this one is the TCP/IP program I think). As of now, this is the latest version (should run on practically any Atari machine).

Have you tried SHEER AGONY ??

I've seen the demo, and quite frankly - I think it sucks!

Well, the graphics are ok, but the gameplay seems a bit - dead ?

I hope the final version is better.

D > Also, are there any conversion utilities which will convert
D > between HPGL,GEM, DXF etc etc? Any help would be greatly
D > appreciated... -- dave

I'm sorry, I'm not an expert. But I use (and think highly of)
Generic/Level 1/First Cadd. It is very old (1986/88) and not very
pretty. But surprisingly, it runs on my TT in TT Medium resolution
with only 2 glitches - its command line shows up inside the drawing
instead of below it where it belongs, and it doesn't 'fair the
curves' when it draws them to the screen. On the first, Generic does
zooms so well that dealing with the command line is no problem. On
the second, although the screen is not correct, the printed output
is. Once again, not a big problem.

Its third problem is common to all Ataris, I think. It takes direct
control of the printer port, and prints rrreeeeaaaallllll
sssssllllloooowwwww. About 30 minutes for a page to my DeskJet.
Nothing speeds it up - not the TT's hardware, and not FastPrint,
Outburst, nothing.

Generic works just fine on a 1M ST, mono or color - even low res, if
you want 16 line colors. It is surprisingly fast, even on a 8MHz
box. I believe that it will run on a 520, but I have not checked.

Generic will convert its .dwg files to or from the pc version .dwg
files.

Generic is not easy to find anymore; the company was absorbed by
AutoDesk/AutoCadd. But it is a heckuva program.

I am looking for a used copy of DynaCadd 3D. If I find one, I'll let
you know how it works. It is probably the answer to your question,
but I couldn't say for sure.

>
> You will need to use Super() to run you routine that changes them in
> supervisor mode as accessing basepage vectors is a privellaged operation
> on the 68K. get a copy of Motorola 68K programmer & user manuals for full
> details.
The addresses are right, but remember they're just mapped ROM (the first
8 bytes, look at $0.w and compare it with what $4f2.w points to, normally
0xe00000 on an STE/TT/Falcon, 0xfc0000 on STs). So there's no chance to
change them on an Atari, all you will get is a bus error because you can't
write to ROM. Just btw, "basepage" is a bit misleading here...

The correct place for an own reset-routine is 0x426.w, pointing to code which
will be executed by TOS during reset, but before _any_ hardware initialisations
have been done. To use that vector, 0x422.w must contain the magic value
0x31415926, otherwise TOS won't touch it. To install your own routine here,
copy the old contents of 0x422.w and 0x426.w and put 0x31415926 and the address
of your routine there. The routine itself is called via jmp, a6 points to
the address you have to jump back when you've finished. No stack has been
set yet, so don't call jsr & co. unless you've set up your own stack.

Btw, installing reset-handlers like this one is not useable if you want to
avoid termination of TOS/GEM-programs. The routines are called after the
hardware reset has already taken place, and GEMDOS is no longer active. You
may use it in "dirty" games, though. But remember: You have to setup all
hardware components yourself, i.e. video, mfp, sound, etc. On machines with
>= 68030 even more (PMMU, amonog others, which is quite tricky).

If you just want that switching the monitor type doesn't cause a reset any
more, there's a much better address for you, but unfortunately I can't
remember it right now. I can look it up, though.

Hope that helps.

Ciao

Thomas

1026. Falcon 8in/8out Digital Recording

Newsgroup: comp.sys.atari.st
Date: 1996-01-17 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4djrob$30k@status.gen.nz>
Source record: 152681

I am having great difficulty confirming the details of this kind of
hardware add-ons for the Falcon. Would anyone who knows please add or
subtract from the following information which I have had sent to me. I
have seen what looks like a reference to this in the SAK (Swedish Club)
magazine (in Swedish).
Also, what is the reference I have seen recently to a Cubase Audio with
32 tracks? (I know it is possible on the Mac.)

This is what I have been sent (please confirm/deny/add etc)

SE 500

SE 800

Suggested Application:

Simultaneous 8 track recording to Hard Disc

8-track Analogue/Digital mixing desk

4 effects stereo sends and returns

Technical specifications

8 channels of seperate 16-bit D/A conversion
using Delta Sigma 64x oversampling conversion

8 channels of seperate 16-bit A/D conversion
using Delta Sigma 64x oversampling conversion

93db dynamic range per channel input

93db dynamic range per channel output

Total harmonic distortion: 0.0095%

Frequency response per channel 15 Hz to 22kz
input and output.

8 channel Analogue in/out unit for the Atari
Falcon and C-LAB Falcon offering 64x oversampling
Delta Sigma conversion technology.

The unit contains 8 seperate 16-bit analogue to
digital converters multiplexed onto the Falcon

128-bit per frame serial input. Channel one is
contained in the first 16-bit. Channel two in the
next 16-bit and so on until the frame is fill

with the maximum of 8 channels.

The serial input standard is running in continous mode as stated in the Falcon 030 hardware manual.

The 8 input channels are adjusted on the front panel of the SE 800 with potentiometer controls.

There are two settings for adjusting the input gain.

There are 8 seperate potentiometers for the 8 individual channels.

The potentiometers are non volatile and retain the settings when the unit is turned off.

Levels of all the inputs are monitored on the front panel with 8 seperate 10-digit LED displays.

One for each of the 8 input channels.

The SE 800 also contains 8 seperate 16-bit output channels (note the 8 channels are not displayed and levels are not set on the SE 800. These must be done with software control.)

The 8 channel work on the Falcons 1 to 8-bit per frame serial output standard in continous mode (see Falcon 030 reference manual)

There is a selectable sample frequency of 44.1kz and 48kz. These clocks are onboard the SE 800 and are sent into the external clock input on the Falcon DSP port. (22.5792kz gives a rate of 44.1kz 24.576kz gives a rate of 48kz)

The sample rate is set on the front panel via switch.

The SE 800 is supplied in a 19" 2U rack mount case. It has a DSP thru-port to keep compatability with all other Falcon/DSP hardware.

The unit contains its own mains filtered power supply requiring 110volts/230volts AC Input.

Analogue inputs and outputs are 1/4" Jack sockets or optional XLR connectors (at additional cost).

The SE 800 is optically coupled to the Falcon's serial inputs and outputs so glitch free operation is ensured.

: Can MINT run xwindows + normal xwin/unix stuff ??

In a word, yes. You'll need at least 4 megs of memory (and even then you won't have a very useful system unless you're just using it as an X-terminal, and xhosting to other machines), and a hard disk is a virtual necessity. The best ratio of simplicity of setup to completeness appears to be given by the TAF distribution set. Once you've got everything running, you'll have an X window machine.

1029. How do you read Mime-encoded e-mail on the ST?

Newsgroup: comp.sys.atari.st
Date: 1996-01-17 00:00:00 UTC
From: ursu@the-fix.sos.on.ca
Message-ID: <tcpnntpd.16.1.17.19.57.32.2781597121.347270@the-fix.sos.on.ca>
Source record: 152684

A friend and I have recently been receiving a lot of Mime-encoded e-mail and I was just wondering if it is possible to unencode it on our trusty ataris. If not, is there a chance that somebody out there might write a viewer for the ST (perhaps as part of the STiK pop/mail whenever it comes out)? It seems to be a disturbing trend.. and if the atari can't read it alot of atari users will be excluded.

Thanx in advance,

P.S. Any confirmation of the scary rumours on www.redsun.net that Atari has fired Ted Hoff, Jeff Minter and a bunch of others and hired Jack Tramiel?

1030. [TT030] Okay... now I got one, now what?

Newsgroup: comp.sys.atari.st

comp.sys.atari.programmer might have been a bit more appropriate.
comp.sys.atari.tech would be semi-apropriate, but less-so than c.s.a.p

"Basepage vectors"? I've never heard of the exception vectors being
called that before.

They are just normal memory locations. It is the Atari hardware which
says "it must be done in Supervisor Mode". (Or have I been reading the
wrong literature?)

Even MagiC 4 has long filenames, and that ain't Unix. Windows 95
has long filenames (sort of) and that ain't Unix.

> > * icons that can be bigger than 32x32
>
> Why? :) And at least Neodesk has a built-in editor that can be used
> easilly, I've yet to work out the one Thing has (and it's somewhere

Thing doesn't have a built-in (or any, come to that!) icon editor.. It
does have a rule editor, which lets you change the mapping from objects
to icons (more sophisticated than Neo's mapping)

Bigger icons are pretty useful if you have a bigger screen - they're
easier to hit and so on. My hard disks look like my TT in 3D, which
would be pretty hard to do in 32 pixels :-)

:
: I would beg to differ. An 8MB Falcon with Screenblaster, a monitor and a
: decent-sized hard drive costs far more than a Pentium with a similar
: specification.

Yes - but the question here is: Who _wants_ a Pentium..? Or Windows?
We wouldn't use Ataris, unless it wasn't the best fitting system for
us, would we? Yes- Pentiums are cheap. But I want neither Windows,
nor Linux. So... The choice is Falcon.

: With that kind of logic, it's a wonder you're not still using a Mattel
: Aquarius.

It wasn't bad logic, I think.. Microsoft really makes slow and unreliable
products. Even PC-addicts admit this. So why should we make the same mistake
most people have made? I've _never_ believed in "majorities know best"
-ideology. No matter how many people can be fooled - they can be wrong...

: I would say that unless you have something in particular you need a Falcon
: for (like Cubase Audio or Apex Media), you'd be well advised to consider a
: PC instead. Not that this type of advice is likely to go down very well in
: an Atari newsgroup.

Well, it depends... A PC isn't a total, perfect solution for a desperate ST-
owner. A friend of mine just got himself a powerful PC beside his Falcon. At
first, my friend was thrilled: "Man, what POSSIBILITIES! I never knew what I
missed when using Atari!!!... After two weeks, however, he today told me
that though the "multimedia-games" were very thrilling, the system itself
pretty much sucks. Memory-settings cause trouble, hard-disk sings all the
time, and life with Windows 95, though pretty, isn't that easy at all. He
finally thought that Falcon _is_ the better computer, but PC has the better
games. The result: he decides to keep and use both =) !

You should always remember this: many of us did _not_ happen to buy an
Atari by accident. We wanted something different from PC-world.
We still do.

Greetings,
Tommi

>join them with my ST?

I have from somewhere a small PD package called 'splitter' which can be used to split and rejoin files between ST and PC. It's easy to use and it works. If you'd like me to email you a copy (UUencoded), mail me :-)

>I have also a null-modem cable and I wonder if I can transfer files
>between ST and PC without using a terminal program?

It is possible to transfer PC->ST with only a terminal program on the ST and a suitable cable. You set the ST to receive an ascii file, and then from the PC you'd enter, from the command line, something like:

print bigfile.asc >com1:

Both RS-232 ports should be set to the same parameters, and 8 data bits must be used.

You could also try archiving the large file on the PC using ZIP, ARC, or LZH. De-archivers for these are readily available for ST's

Has anyone got a UUCP account working ? If so can you tell me with
what software ie: Upoint light . If it's with Upoint how did you
get a working version as I have tried contacting Stefan Brusch but
can't find him .Any ideas on where I can purchase the Medium version
as the E-Mail in the light version doesn't work at all .
Any leads appreciated ! Thanks !

1042. CD-ROM on STE...

Newsgroup: comp.sys.atari.st
Date: 1996-01-17 00:00:00 UTC
From: lnonvei@jagor.srce.hr
Message-ID: <4dhf7q$1e8@bagan.srce.hr>
Source record: 152697

Hi there,
I want to add a CD ROM device to my STE. In some magazines I saw DMA to
SCSI interface, ROM port IDE CD-ROM interface and AT BUS card.
Which one should I get? Any experiences?

Thanx.
Loris

P.S. AT-BUS/TOS card seems good choice for 109 DEM in Germany.

1043. FS in UK: Xtra-RAM board 8Mb for MEGA ST

Hello once again...

I've got a Mega 4 with TOS 1.2 and BW display. I got an _original_ Ultima VI -packet today (:-))), but when I tried to run the install-program, it just resetted the computer -- the game probably needs a colour monitor..? Well, I downloaded two low resolution emulators, coloremu.prg and mediumem.prg, from ftp://ftp.funet.fi/pub/atari/screen. The programs were without any documentation. When I tried to run them, both of them also resetted my ST..:(If you know what's the problem, please let me know! THANKS! :)

First off, what backup software are you using? I have a similar setup (Mega 4 STe, 245 MB HD, 2 partitions, 1 tape drive) and have no problems using Beckemeyer Development's tools. I imagine Diamond Back should not have any problem either.

I beleive ICD's email address is: icdinc@genie.geis.com (someone please correct me if I'm wrong).

: NVDI are you using, what is inyour ASSIGN.SYS.
:
: NB: I installed it whilst running NVDI 2.51 (no GDOS). Could this be the
: problem?

Hmmm... I just dropped the .SYS file into my GEMSYS folder among NVDIs (3.02) own drivers - and the next time I booted up, NVDI recognised the driver. However, I cannot choose anything else but DJ660C now, from the NVDI printer Control Panel... Fortunately, applications seem to be able to use both this driver and NVDIs own ones... You have the CPX module active all the time, I believe? I have.

Btw, it's weird, this 660C. I just managed to tune-up my Calamus SL to print somewhat correctly with 660C - and the results are FANTASTIC!

Yes - Calamus & 660C produce far better results than ANY demo doc I've seen from HP this far. Even skin-tones are natural! The fabulous 850C DeskJet hardly matches this =) ! Atari software seems to be superior to many, if not most, PC-applications in what comes to print quality!

But one problem more: in 600 DPI mode, some lines seem to disappear in LaserJet 4 600 DPI mode! Pretty many, actually. I suspect wrong RET settings. Who could help here?

Tommi

1055. Euro-Doorgames?

Newsgroup: comp.sys.atari.st

From: Rosemary MacCallum <mccallum@inwave.com>
Message-ID: <4djvl0$a0m@homer.alpha.net>
Source record: 152760

Does anyone in the UK know of any decent Atari ST/e etc., BBS doorgames that are available? Ones programmed in the UK or Europe etc?

Search as I have for about 2years and I've come across a total of ONE! (A version of SOKOBan that was, admittedly, well done, but I couldn't get it to work online at the time... <duh!>).

If you are a UK BBSer then could you check the doors section on your local for me? Anyone with any info out there?

Actually, I wish i could remember where I found the SOKO one now, with a little programming (a sheller) I could probably get it to run ok...

Later...

Actually, the falcon, has a special Atari board....but with a 72-pin,
'standard' SIMM card fitted into it. Only one slot though. So in theory,
(don't blow up your falcon and say it's my fault :)), you could change
say, a 4MByte SIMM to a 16MBytes SIMM, change the little red jumper switch
around, and he-presto.....a 14MByte Falcon. These SIMM cards are _not_
slow, they are of the 70ns type I believe.

Question: I thought the falcon could have 16MBytes of RAM, but only 14 were
available when MultiTos was being used? At least, I think that is what is
said in my (very old) Falcon promotional leaflet.
>
> 3. BlowUpFX speeds up individual chips but not the bus(es), right? So
> only processing of in-cache data would be faster, but processing of

ST needs:
GND
+ 5VDC
+12VDC
-12VDC (seriall Interface)

Falcon's PowerSupply:

GND
+ 5VDC
+12VDC

Your ST miss the -12VDC

Finaly: PowerSupplys like 1040, 1040ST(E) Falcon use the same Plug..

PR>Have you tried the extended version of Strunk's TeX, that is MultiTeX
PR>?? I'd find it hard to imagine that someone could find the Lindner's
PR>shell, previewer and so on nicer than MultiTeX.
MultiTeX is not quite bad, but the TeX version is still 3.141, Lindners is 3.1415. I strongly recommend Lindner's version, and the TeXShell v3.76 can even be used under MultiTOS and MagiC. All You need is an alternative Desktop like GEMINI or THING. You should configure TEXSHELL.PRG as a .TOS-program or rename it to TEXSHELL.TOS. This will force all Output to be shown in the MINIWIN/VT52-Window instead of writing directly to the screen.

For both Strunk-/Multi- and Lindner-TeX i also strongly recommend an alternative Previewer. The best one seems to be DVI from Markus Pristovssek, which is also a far better Printer Driver. The current version is 3.0 and can always be found on
ftp://ftp.cs.tu-berlin.de/pub/atari/TeX/

Keep on TeXin'
best regards, Tom

Dunno. My local BBS gates to the 'net. I just logon with STalker, download the messages, and read 'em and answer with Mountain. Works great, once you get it configured. Hint: dl to a sizeable RAM disk, and set up the 'work' folder to the same ram disk. Fast - and you don't have to delete!

Source record: 152608

Just a note on this.

HP have a very good webb site at "hp.com" and on there is a
file listing all the HP DeskJet 500 print codes. Look at :

ftp.hp.com/pub/printers/support_doc/dj500.exe
HP DeskJet 500 series printer PCL commands (PCL format).

Yes it is a DOS file ! but if you run it you get a .pcl printer file
that you can dump to your DeskJet.

It only lists the 500 series codes, I have had a quick look but
there does not seem to be the same sort of thing for the 600/660 printers.

If this group is really interested I could turn it into a text file
and post it here, let me know.

It's still rather a hassle having to save the message to disc first, particularly
if it's just a small picture or sound clip. If it's a program or something then
it's not so bad but one integrated with the mail reader would be much easier.

> which system they were going into.

No, only an SVGA monitor. You need special Atari RAM, or you could buy that gadget which allows you to fit SIMMs - but I've heard that it causes screen interference. Also, the cheapest hard drives available are standard PC internal drives. I think they're 3.5", but the Falcon can only take 2.5". If this wasn't the case, you'd get entry level Falcons with 500MB and 1GB internal drives, not poxy 80MB ones.

> HOWEVER, the Atari's have MUCH smaller resource footprints than
> winclones. An atari would have similar functionality with 1/4 the
> RAM and 1/10 the disk space.

Atari software is generally more economical, but your figures are a huge exaggeration. You'd only achieve that disk space ratio if you deliberately packed your PC's hard disk with the bulkiest packages you could find, and installed all the "extras" (import filters, thesaurus etc.). If you build up a collection of graphics, samples, MIDI files etc., they're obviously going to take up exactly the same amount of space (not counting the "slack space" on large partitions).

As for memory, once again Atari machines have the "advantage" that almost all software is written for 1MB (or occasionally 4MB) machines, usually without hard disks. But PCs have the advantage of separate video memory. If you could get 1024x768x256 with a Falcon, which you can't (and I couldn't live with less), it would consume 768K of your valuable RAM. As it stands, you can lose up to .5MB.

> If all one really needs is a tugboat, it is foolish to spring for

>
>MiNT uses v2 minix though ?? I have a 100meg Minix partition no prob's .

It can do, but that's not the default. The default is v1 partitions (which
also results in the 14 character filename limit)

Apart from the 32 bit access and filename length, other changes are support
for access and creation times, and 16 bit gids.

>Strangely also mountable onto my Linux system even though AFAIK that is a
>v1 minix driver. It complains about bad magic number if I try to fsck.minix
>it ..otherwise it is fine .

That's interesting... /usr/include/linux/minix_fs.h (on the PC, although I
asume the x86 version is the same) includes the following comment,
suggesting it doesn't yet support v2 filesystems.

```
/*
* Thanks to Kees J Bot for sending me the definitions of the new
* minix filesystem (aka V2) with bigger inodes and 32-bit block
* pointers. It's not actually implemented yet, but I'll look into
* it.
*/

>I can still buy it from?

AFAIK, Atari never released Unix for any Atari computer commercially.

However, this message is being posted from a TT030 running Linux, a
POSIX-compliant Unix clone, and X-Windows. Linux is freeware, and is
available on the net via anonymous FTP from tsx-11.mit.edu in
/pub/linux/680x0.

I recommend doing a Web search for the Linux FAQ and reading that first,
though. It isn't exactly plug-and-play yet, but it's getting there.

From: ai066@FreeNet.Carleton.CA
Message-ID: <DLE71v.3xC@freenet.carleton.ca>
Source record: 152616

Just checked my WWW stats on the little site that I run when I have the time to code up some html, and I found, much to my amazement, that my mega ste page was by far the most popular thing that I had, with over 250 accesses! I haven't updated it in a while, but am currently adding some new info to keep those other 249 mega ste users on the net happy :)

So, to all those other mega ste users out there, thanks! BTW, anyone with a mega ste 4 mwgs, hard disk, tos 2.05 running STiK/CAB? I seem to have a lot of problems getting my setup working properly. I think that I'm getting time outs on my DNS lookups, but I know that I have the right DNS set.

Any hints?

<SNIP>

I recently needed a CAD program and dug out MASTERCAD 3D, which was given away in its entirety on an ST Review cover disk - one of the few still available as a back issue from Atari World. Despite only having a little instruction from the mag to go on, a few hours work quickly made everything clear (I've never used anything like this before), and I was able to save screen shots in Degas format for printing from Pagestream - jagged on the 3D constructions, but very useful - I'm now the owner of a brand new home-made built in wardrobe (gotta keep the wife happy about the money I spend on this Atari, you know ;-))

If you're going to that much trouble, you might as well replace it with
a newer, better drive. You're still out of luck with the old
misaligned disks though, as far as I know.

Our coolens scribbled illegebly to Our All about Magic4 and background operation on the 17 Jan 96

c> I recently bought Magic4. Reading the manual I found out that you
c> should be careful running floppy and harddisk access in background.

Hi Coolens,

I think what it meant was that one should be careful in letting background programs write to the drives - If for example two progs both tried to write to the drive using illegal routines that MagiC couldn't detect, there isa possibility they could write over each other's data and effectively ruin the filestructure.

If this is indeed what was meant, then I don't think it's a serious problem in all honesty - few progs will write to the discs automatically anyway, and those that do under MagiC are likely to be well written anyway.

Wouldn't worry about it!

Cheers,

: it's called HP850C01.LZH, I'm told that it's on ComputerInsel BBS in Germany,
: but might be available for FTP somewhere??

That would _really_ be interesting to test =) !!! I'll have to ask from
people in MausNet, Germany...

Btw, I noticed that Calamus SL '93 is well capable of making outstanding
results even with DJ-550C driver, but there are some obstacles. First,
color separation module must be set to "standard" i.e. no "cyan from
black", etc set on - and neither black separation set on at all. Only
cyan, magenta and yellow separation lines in use. More, printout linearity
module should be set for "DJ-550C". For some reason, CSL doesn't save
these settings - so by default, every time you launch Calamus, you will
get unusably dark printouts before these changes.. =(
I don't know why this is so, but it is..

Tommin

One good GEM word processor you could try out is Marcel - it's shareware, and among the things it can do is load and save in Rich Text Format (RTF), which will be important if you want to transfer documents between platforms and other programs like M*cr*s*ft Word. You could also look out for Everest (shareware), and Edith Professional (commercial, but a good demo is out there).

>I am looking for a copy of SimCity for the Atari ST

You're in luck, I think <g>. Atari World magazine will next month be relaunching Sim City and two/three other games, courtesy of Compo, as a special offer for readers. Cost will be 9.99ukp (I think) plus p&p to your part of the world of course. There will be a number of other special offers too.

>host adapters, etc.

You can get info about how to install and modify a HD disk drive for
Atari ST use in my FTP area. Tell me if you can't download it or
anything as I've just set it up and might have done something wrong.

ftp://ftp.sn.no/user/hallvart/atari/sony_144.zip

This file/image describes how to install/modify the disk drive unit
itself- in addition you need to install a "HD module" which is a
simple electronic circuit connected to the 1772 chip (if it works for
HD) or the "AJAX" chip.

I'll hopefully get back with this information when I get the time to
work it out and compile it.
But for now, maybe someone else can help, or you can buy an assembled
module.

> Loris
>
>P.S. AT-BUS/TOS card seems good choice for 109 DEM in Germany.

Yes, but the problem is that I haven't actually been able to get hold
of an interface like that for the *STE* (getting one for the ST/F/M is
no problem though).

I've tried for ages to get in touch with a company who's supposed to
make these interface cards for the STE, but as yet... no replies.
If anyone else reading this has been able to find out where these
cards for the *STE* can be found I'd really like to know!

Hi Michael, A friend is having trouble connecting to our PPP services at the university. Do you know of any dial-up winsock she can use to connect? Please advise. Thanx, Jim (jhamman@csus.edu)

I'm using an Atari ST with CAB and STiK for browsing the web, dialing in at 19,200 bps.. The browser works with other BBS's that support SLIP, I have even tried logging on with my friends computer via SLIP and it would not work, PPP works great but as of right know STiK which is like Trumpet and CAB that's like Netscape only support SLIP.. Any help would be appreciated..

They have made one Falcon-specific catalogue 4 moths ago, but there hasn't
been any newer catalogue since. Heine Svendsen, the boss, has difficulties
getting the time for making a catalogue once every 2 months, so it has been
cut down to every half year or somthing.
He prefers that people call Indigo2 to hear about new prices etc.etc., but
it's always possible to get a short catalogue, which is more like a pricelist.

1096. ST TurboBlanker equivalent?

Newsgroup: comp.sys.atari.st
Date: 1996-01-18 00:00:00 UTC
From: gio@wcl-rs.bham.ac.uk
Message-ID: <4dltg0$jrj@sun4.bham.ac.uk>
Source record: 152775

Does anyone know of a screensaver for an STfm which works in a similar manner to TurboBlanker on the Falcon, i.e. speeding up processing whilst operating?

Failing that, an idea of how (if at all possible) this might be possible - I'm working on a computationally intensive program, and evry ounce of speed would be useful.

TIA...

Be seeing you...

The ST screen is so much smaller that the amount of memory bandwidth consumed
by video updates is not really significant, so even if something like
turboblanker was possible it wouldn't gain you that much.

As for whether it's possible, I don't know but I don't think so. Certainly I
don't recall seeing a way to switch off the shifter documented, but I don't
have the compendium on me to check.

|||An 8MB Falcon with Screenblaster, a monitor and a decent-sized hard drive
|||costs far more than a Pentium with a similar specification.
|| Actually, it's the base falcon that would cost more if anything.
|| All other components would be of equal cost regardless of
|| which system they were going into.
|
|No, only an SVGA monitor. You need special Atari RAM, or you could buy that
|gadget which allows you to fit SIMMs - but I've heard that it causes screen
|interference. Also, the cheapest hard drives available are standard PC
|internal drives. I think they're 3.5", but the Falcon can only take 2.5".
|If this wasn't the case, you'd get entry level Falcons with 500MB and 1GB
|internal drives, not poxy 80MB ones.
|
|| HOWEVER, the Atari's have MUCH smaller resource footprints than
|| winclones. An atari would have similar functionality with 1/4 the
|| RAM and 1/10 the disk space.
|
|Atari software is generally more economical, but your figures are a huge
|exaggeration. You'd only achieve that disk space ratio if you deliberately
Actually, for some applications 10:1 is VERY conservative.
One needn't even bother with the extras. Standard installations
will fill up your HD quite quickly even without them.
Comms: 5M vs 500k
DTP: 15M vs 1.5M
WordProc:15M vs 1.5M
C: 50M+ vs 1.5M
OS: ~8M vs 200K

Memory Overhead: 5M vs. 300K
|packed your PC's hard disk with the bulkiest packages you could find, and
|installed all the "extras" (import filters, thesaurus etc.). If you build
pure bullocks
|up a collection of graphics, samples, MIDI files etc., they're obviously
|going to take up exactly the same amount of space (not counting the "slack
|space" on large partitions).
|
|As for memory, once again Atari machines have the "advantage" that almost
|all software is written for 1MB (or occasionally 4MB) machines, usually
|without hard disks. But PCs have the advantage of separate video memory.
|If you could get 1024x768x256 with a Falcon, which you can't (and I couldn't

|live with less), it would consume 768K of your valuable RAM. As it stands,
|you can lose up to .5MB.
And gain it again if necessary just by changing your system resolution.
Memory on a frame buffer card can only be used for that purpose.
Also, bus contention is fun as well as underoptimizeable.

I use the SCSI interface (ICD Link 2) which is pretty damn good. It is VERY fast
and works really well, it also allows you to use any hard disk or CD Drive
(pretty much). But I don't know much about the Cart port ones but the SCSI is
probably the best one but it realy depends on how cheap it is. Also, I have been
told that the ROM port interface only works with a very small number of drives.
All IMHO & AFAIK of course :)

If you have a standard Falcon, or an accelerated Falcon with just a
clockdoubler, SpeedRes.Card or a FX-card, which all bursts the
original on-board 68030 to higher clocks, the address lines are still limited
to 24-bit, hence 16 MB limit. A stupid design method from Atari, reducing
the 32-bit address Bus of the 68030 to 24-bits. Can't believe they did
it for compatibility, if so - it was a stupid move.

The FX-card can however manage up to 32 Mb with some help from the
PMMU in the 68030. It does somekind of paging with memory above 14 Mb.

BUT if you accelerate the Falcon with an accelerator card with a new CPU,
like The AfterBurner040, Mighty Sonic030, The Hawk030 (48 Mhz 68030) the
address lines will be 32-bits and hence NO 16 MB limit. The limit would be
something like 4 GB's(!), haven't calculated on it.

> 2. Since the slower ST-RAM is shared with video/DMA and TT-RAM isn't,
> you could not run a Falcon with 100% TT-RAM, could you? (4MB ST-RAM/
> 10MB TT-RAM seems an ugly hack to me. :^( )

No Atari-computer can "live" without ST-RAM. ST-RAM acts as both video and
audio RAM and also as buffer for DMA-devices.

4MB ST-RAM/10 MB TT-RAM is by no means a hack, it's pretty much a almost
normal config for newer Atari-computers, and it works fine.

I have 4 MB ST-RAM and 4 MB TT-RAM, works perfect!

> 3. BlowUpFX speeds up individual chips but not the bus(es), right? So
> only processing of in-cache data would be faster, but processing of
> out-of-cache data would still be limited by bus speed?

The ST-RAM Bus can be increased from normal 16 Mhz to 20 Mhz, which gives
higher 256 and 65536 color-modes on VGA, and 25 % faster graphics.

The TT-RAM bus is faster than the ST-RAM bus, not just because of no
video-access, but also because the 68030 is able to write to memory
faster (in fever bus-cycles) if it has a direct RAM-access.

> 4. Is there any way to increase actual bus speeds on the Falcon (along
> with increases in processor clock speeds)?

Yes, the FX-card does it, with both ST-RAM Bus and TT-RAM Bus.

The AfterBurner040 does it with the TT-RAM access speed.

> 5. Could someone please be so kind as to post/mail specs for the
> Afterburner 040? That sounds like *my* kind of HW upgrade!! :^)

I have no specific specs. But I know that the AfterBurner040 has a
33/66Mhz 68040 with daisy-chained expansion BUS. And it can hold up to
64 MB (or was it 128 MB) TT-RAM.

> 6. I read with disappointment the recent articles about the TT and
> Falcon having LocalTalk (yecchh!) ports and not Ethernet ports. Is
> there any product that would give them true Ethernet capability?

For the TT there is one EtherNet card, don't remeber the name or company.
And somebody is developing a driver for a SCSI-EtherNet adapter
(originally for Mac's I think) to run on the Falcon's SCSI-II port.

b> adapter, and tried various other things in the last few days. Nothing
b> has helped and it seems to be getting worse and it's driving me nuts.
b> HELP!!

I suspect part of this is down to incorrect settings in your NEWDESK.INF
files. At the Desktop go to the view menu and ensure Size To Fit is
selected. Load each INF file in turn and ensure they are set correct

However, from the sound of the other problems you are getting I'm wondering
whether there is some corruption of the Newdesk files themselves, which may
have unset the Size To Fit parameter as the most obvious symptom, so maybe
it's better advice to manually edit the files rather than load and resave
Newdesk files that are possibly corrupt in other places.

It was the endless importing and exporting of files from one to another I
was trying to avoid. RTF seems like a good standard and I was surprised
not to find an implementation in the revised Import/Export files when I
upgraded Pagestream from V2.1 to v2.2. Hence the enquiry. Just trying to
save 30 seconds here and there......

My friend who was looking for this info asked me to post this up here. He's
not able to link into this area from work, but he's contactable at
Derryck.Croker@bbc.co.uk

I'm keeping him up to date with interesting postings from here...

==========
Here's some codes provided by a friendly Archie owner from a driver creation
prog on that platform.

Plug these codes into a suitable printer control acc/CPX, a good one is
code.cpx, V1.03 of which has some extended codes already included. The
interface is excellent BTW, pop-ups and all, which you can program your
by including formatting codes in the control code file.

```
27,"*","o","-","1","M" ;EconoFast mode
27,"*","o","0","M" ;Normal mode
27,"*","o","1","M" ;Best mode
27,"*","o","0","M",27,"&","I","2","M" ;Normal mode, special paper
27,"*","o","1","M",27,"&","I","2","M" ;Best mode, special paper
```

Also HP's free Fax-U-Back service can provide control codes for the 500
series of printers, many of which will be useful on the 660C.

The Speedo GDOS HP660C.SYS driver and its CPX were (apparently) provided by Epson France, it is readily available from any BBS connected to the FAN network. I have translated most of the CPX, though some of it defies my French dictionary, and so will have to wait until I can persuade a native French speaker to have a look at it! :)) There are some oddities with attempting to print in other than "Best" as already described, even matching black and colour resolutions at 600*300 dpi causes severe misalignment of colour and B&W (or N&B as the French have it!) Imagecopy's manual says that the 600*300 dpi of recent DeskJet printers isn't supported as that resolution is for printing graphics text rather than images. (I can't see the difference, but I'm sure there is one!)

There is also an HP850 driver for Calamus around which *might* prove useful, it's called HP850C01.LZH, I'm told that it's on ComputerInsel BBS in Germany, but might be available for FTP somewhere??

>Does STiK work with this setup at all? It works fine under TOS.

Disable the preemptive Multitasking in MagiC4!

I don't know who makes the Problems, but 1 ore 2 Minutes after Connect my
send-LED on the modem was allways on!

So i disabled all ACC's and AUTO-Folder-Prg's and it works. So I saw, that
the "MagiC Timeslice"-CPX which enables in my configuration the premptiv
Multitasking is the Problem :-)

So set Magic4 to kooperativ (is this a korrekt English ??) Multitasking.

Greatings Michael

Esscode will handle MIME encoding and decoding. Or at least it's supposed to. If your running Mint there is a version of mpack for it, I don't kow about the Mint port but I know that some encoders out there will make messages that mpack can't handle.

t> NVDI printer Control Panel... Fortunately, applications seem to be able
t> to use both this driver and NVDIs own ones... You have the CPX module
t> active all the time, I believe? I have.

Having grabbed the hp660c.zip file now (thanks everyone) I notice it doesn't have any docs with it. Running the Install.prg copies the SYS driver file to my GEMSYS folder, copies the CPX to my CPX folder and then modifies my ASSIGN.SYS ...

Checking my ASSIGN.SYS I see it just appends details to the end of the existing file, so I end up with 2 lots of everything (actually 3 by the time I'd run Install again...).

I don't know whether this is the problem, but check what it's done to your assign.sys file...

> available when MultiTos was being used? At least, I think that is what is
> said in my (very old) Falcon promotional leaflet.
That's because of the 24bit limit. The ROM must be in that area somewhere,
and it's located at 0xE00000. So you lose the upper 2 MB of your 16, because
for the Bus, there's ROM.

Ciao

Thomas

>I'm interested in joining such a list. Anyone know how to start
>something like this? Anyone else interested in a Notator/Creator
>mailing list, or is it just me?

I'm not really an expert on these things, however, I do run
the STOS mailing list, and so know a bit about it. To start it, you need
to find a ISP who is prepaired to run a mailing list - they have software
(eg. majordomo) which handles the xxxx-request and xxxx email addresses.
(xxxx is the list name). For example, I emailed postmaster@cs.man.ac.uk
(ie the admin at my dept.) to find out if they could run mailing lists,
and was passed onto the correct person - If you want to run a mailing list,
then I would recommend mailing your service provider, and asking if they
do it.

Check out the newsgroups comp.mail.list-admin.policy and
comp.mail.list-admin.software for more technical details...

Hope this is of some use (feel free to mail with questions)

Michael S. Hill (msh@den.mmc.com) wrote:
:
: Many thanks for the helpful replies I received from Bruno Lavigne, Keith
: Tomlin, and David Greenhough. The information they sent me gave me a basis
: for more questions:
:
: 1. Where is the 24-bit address limit imposed? (Bruno stated that ST-RAM
: has 24 bits of address, but TT-RAM has 32 bits.) Is it at the bus
: level? The MMU? From comments I've read here, I would guess that,
: even if TT-RAM has 32-bit addressing capability, there is some other
: limit inherent in the Falcon's HW that would prevent it from being
: able to address more than 16MB linearly? (I hope that's not true!)

I`m not 100% sure of this, but I believe that the 14Mb limit is because the Falcon has the HW-registers mapped at the same locations as the ST. It`s been a while since I programmed demos on the ST, but I think these registers are mapped from 14Mb-> on the ST. Correct me if I`m wrong.

:
: 2. Since the slower ST-RAM is shared with video/DMA and TT-RAM isn't,
: you could not run a Falcon with 100% TT-RAM, could you? (4MB ST-RAM/
: 10MB TT-RAM seems an ugly hack to me. :^( )

No you need ST-RAM for use with Video and DMA.

:
: 3. BlowUpFX speeds up individual chips but not the bus(es), right? So
: only processing of in-cache data would be faster, but processing of
: out-of-cache data would still be limited by bus speed?

The bus is accelerated to 18 or 20MHz.

:
: 4. Is there any way to increase actual bus speeds on the Falcon (along
: with increases in processor clock speeds)?

Apart from the FX-card you have SpeedUp (The Polish 25/50MHz accelerator), Speed Resolution Card (20/40MHz) from Hard & Soft and a 18/36MHz accelerator also from Hard & Soft (I have this one myself, but as it has a german name I don`t remember what it`s called :-).

:
: 5. Could someone please be so kind as to post/mail specs for the
: Afterburner 040? That sounds like *my* kind of HW upgrade!! :^)

I want this one myself! But it`s a bit expencive compared to the similar accelerators for the Amiga.

:
: 6. I read with disappointment the recent articles about the TT and
: Falcon having LocalTalk (yecchh!) ports and not Ethernet ports. Is
: there any product that would give them true Ethernet capability?

There are some DIY projects floating around the net. There are also Ethernet-cards that connects to the SCSI-bus, but I don`t know if there are any Atari-spesific drivers for them.

I use a program from JP Deziel of Chelsea, Quebec, which does fades,
wipes, etc. The menu is in med res, but the frames are in low res. Also,
it has no features for actually creating the frames. Something such as
Degas Elite, Seurat, or CyberPaint are needed for the frame creation.
CyberPaint also is an animation program, with some far-out effects all its
own. Frames and animation take quite a bit of RAM; 4 Megs gets me about
100 frames.

1130. CD ROM Question, Mega STe SCSI question

Newsgroup: comp.sys.atari.st
Date: 1996-01-19 00:00:00 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <4doq7d$klc@bigboote.WPI.EDU>
Source record: 152508

1) Will the cheapo AdSCSI work with 2x SCSI CD-ROM or is the Link or + necessary?

2) I know there has been lots of discussion about the SCSI controller in the Mega STe but i need to refresh and ask a new question

did some Mega's come with the AdSCSI controller that could handle more than one device, and if so, is there a way to check this via the serial number or whatever without opening the case? if my machine has the one device controller, how easy is it to change that to an AdSCSI or +?

if it helps, i have TOS 2.05 (anybody have some spare 2.06 roms they wanna say goodbye to?) and the 1.44 floppy upgrade, and my machine came with the ICD AdSCSI CPX and software.

thanks

rhett@wpi.edu

Which is why you want to use custom installations, so you can leave out bits
you're not going to use.

> Comms: 5M vs 500k

5MB?! I used to use (DOS-based) Panther, which was 1.5MB at the very most.
Or there's always Windows Terminal, which is included with a default Windows
installation.

> DTP: 15M vs 1.5M

My Aldus Pagemaker installation at work takes up 4.5MB.

> WordProc:15M vs 1.5M

Lotus Amipro: 10.5MB, including a dialog editor and 2.5MB of macros and
stylesheets which I've never used.

> C: 50M+ vs 1.5M

That 50M+ looks suspiciously like Visual C++ to me. So where's the Atari
equivalent? At work I use Microsoft Quick C 5.1, at 2.5MB (no Windows libs
though). And I have to say, I don't know of any ST C compiler which offers
full GEM libraries and a resource development kit in only 1.5MB.

> OS: ~8M vs 200K

8MB looks rather low, but thank goodness the bulk of it is on the hard disk
and not ROM chips. I upgraded my STE from TOS 1.6 to 2.06, and I'd rather
not go through that again, thank you very much.

> Memory Overhead: 5M vs. 300K

If that was even slightly true, there would be no such thing as a 4MB PC.
My best-ever time on Windows Solitaire was achieved on a 4MB 286.

I'll sacrifice some disk space for the extra functionality and bits and bobs, thank you very much. Disk space is cheap; functionality isn't.

Frankly, constructing a pro-Falcon argument around the fact that comparable software (where it exists!) uses less disk space and memory would be funny if it wasn't so sad.

>|If you could get 1024x768x256 with a Falcon, which you can't (and I couldn't
>|live with less), it would consume 768K of your valuable RAM. As it stands,
>|you can lose up to .5MB.
> And gain it again if necessary just by changing your system resolution.

Super! I never realised the Falcon had such a strong selling point.

> Memory on a frame buffer card can only be used for that purpose.

Well, I would hope so. This is why it's not counted when you talk about an 8MB PC.

> Also, bus contention is fun as well as underoptimizeable.

My PC is set up just fine and works perfectly. If you're going to drag the bus into it, I doubt the Falcon can compete with PCI. And what were those dreadful revelations I was reading in this very newsgroup about Falcon SCSI problems..?

PCs do have serious problems in certain areas, but there are a lot of people doing a lot of work and producing a hell of a lot of stuff for them.

>|| If all one really needs is a tugboat, it is foolish to spring for
>|| a full deck aircraft carrier...
>|Today's aircraft carrier is tomorrow's tugboat.
> Making it one iefficient tugboat.

Let's just see who can still find new software for their machine in 5 years' time, shall we?

And to think that three years ago, I was heavily pro-Falcon and anti-PC. Self-righteous Falcon-owning tits are becoming as irritating to me now as Acorn Archimedes owners were back then (and still are). Anybody spending a huge amount of money on an underspecified and commercially unsuccessful machine is obviously going to defend their purchase, but so many Archimedes (and, increasingly, Falcon) owners can't see why anybody would recommend something else. I must have been mad to get involved in this thread in the first place. It's just turning into a "my computer is better than your computer" slanging match, which can never be won, and is no use at all to the person who originally asked if a Falcon was worth buying. And I'd have to say the answer is no, unless you have some particular need for it. Note that this is different from asking whether your existing Falcon is worth hanging on to.

What we need is for someone in Europe to come up with something
as good as PGP! Then I can get it off Hensa and Uncle Sam can go chase
himself! We can't export that type of stuff, but we can Import and use
it! 8-) I think it is a really dumb policy as it keeps US companies out
of a very fast growing part of the Global economy! Information Security
is going to more and more of a concern in the near future!

There are several VME bus ethernet cards for the TT.

Also there exists a circuit diagram and drivers for connecting a D-Link DE600 pocket LAN adaptor (BNC,TP or BNC/TP) to the cartridge port of a TT or ST. It might work on a Falcon also. There are also some fairly early revision device drivers for the interface supplied with the latest versions of MiNT-Net.

I'm slowly collecting all the parts to do the DE600 version for my TT. The DE600 device itself was for a few years very hard to get. However a new combo version (DE600CT) has recently become available (at least in the UK). Not having built the interface yet - I can't say 100% this version will work - however it is shipped with *exactly* the same drivers as the original DE600 so I'm hopeful.

:-)

>Greetings,
>Erik Mollink.

Video Supreme v1 was given away on the last ST Review cover disk here in England just as the magazine was closed down. The last of the back copies are available from COMPO here but the new version is AFAIK available from Goodmans International PDL V2 for 20uk pounds approx.(Licence ware)

It features user defined scrolling (speed, font, direction) over LOW rez backgrounds in degas, neo or tiny, which can also be animated,faded, melted, merged and variously wibbled on or off the screen with a variety of FX. Sound is also supported in either .MUSic files or .SAMples which can in turn set the cycling speed for the degas pallete!

Version 2 got the ST Format Gold award in May 95

Obviously it is a 16 colour, Low Res prg and you did say you wanted Med Rez but without expensive genlocks it does a fine job.

hope this is of some help.

AFAIR you need v5.60 if you want to program for the Falcon or MTOS. It
contains the new libraries and the MASS book (essentially the manual for the
new libraries).
It also contains a version of MAKE, AR and a Profiler (not very good).

I don't remember seeing anything about this either; I don't think it will
speed up code exectuion,AFAIK the video memory is accessed when the CPU is
not using memory.

One possible idea might be to set the number in the base address counter
(perhaps I have the wrong name here) to zero.

Or, is there some way to alter the display Enable signal to shorten the
display time.

Program load flags are in the file itself (I can't remember the offset now,
I used to know it well from changing flags with a sector editor) and nothing
to do with the filesystem. I don't know whether they're necessary under MiNT
but I suspect so, and they're certainly possible.

GEM is a nice (IMO of course) simple and fast GUI. Although it
lacks features it's easy to use and doesn't slow the computer
down as much as many others. It works a bit like the mac.

The underlying operating system, TOS, is rather nasty and MSDOS
like, but you can install a patch called MiNT that gives it
multitasking, proper filesystem support etc.

As for alternatives, Magic is a replacement that is faster and
multitaks well, but is compatible with it. You can also install
linux.

>Also, should I have the option of choosing TT high resolution?

No. TT high resolution requires a different monitor. At the time
the TT was released no VGA monitor would do that resolution
(1280x960 mono) so you need a special monitor, Atari's own one was
the TTM194, which was a 19" one. Any monitor with mono ECL inputs
and capable of the right sync rates would do.

>Needless to say, I am lost... Where on earth is the shell?

There isn't one in ROM. You can get one, most of the unix ones have
been ported.

>Anotherthing... My system has a modem1,modem2,serial1,serial2
>port... that is 4 serials I counted. What gives?

Sorry? There are four serial ports, what about them?

>Also What is this "Warp9" accelerator.. like what CPU and speed?

Warp 9 is a "software accelerator". Basically it just replaces the
rather badly written graphics routines in the ROM with some much
faster ones.

1144. Backupsoft for SCSI-Streamer ????

Newsgroup: comp.sys.atari.st
Date: 1996-01-19 00:00:00 UTC
From: Jan Ermatinger <jan.ermatinger@ubs.ch>

Hi,

I've got a Falcon030 and a SCSI Streamer from EXABYTE (8200) 2.2GB.
Is there a backupsoft for SCSI Streamer ?

Thanx,

e-mail: jan.ermatinger@ubs.ch

>more or less, I'm still looking for a program that can:
>- Easely create scrolling film-credits (with effects, wipes, fades)
>- Works on medium resolution.
>
>If such a program doesn't excist I can use a program that creates a
>slideshow from med-res pictures with effects such as fade, scroll,
>wipe, etc., etc.

I got a prog called Video Supreme on a cover disk a few months back, I
think it only runs in low rez, but it has built in fades/links and supports
a few image/sample formats. Kozmic4 is also worth a look, it quiclky creates
some pretty impressive (for an ST) screens and has a slideshow feature with
fades/merges etc.

Cheers,
Smn.

Look at my home page. There you can get Big-DOS 6 for the Atari. The hard disk must be "formated" on the PC.

13Megs... still not to far off of the 15M mark.
Nevermind the fact that it's a DTP and NOT a wordproc,
comparing to Pagestream.

|
|| C: 50M+ vs 1.5M
|

|That 50M+ looks suspiciously like Visual C++ to me. So where's the Atari
Watcom
Symantec
MSVC
and Borland are all over 100K for a full
install. Some are 200K+.
|equivalent? At work I use Microsoft Quick C 5.1, at 2.5MB (no Windows libs
|though). And I have to say, I don't know of any ST C compiler which offers
|full GEM libraries and a resource development kit in only 1.5MB.
Lattice C
Mark Williams C
Megamax C
Laser C
also, an ST resource editor is only 200K.
|
|| OS: ~8M vs 200K
|
|8MB looks rather low, but thank goodness the bulk of it is on the hard disk
|and not ROM chips. I upgraded my STE from TOS 1.6 to 2.06, and I'd rather
|not go through that again, thank you very
If the single most trivial upgrade inside of an ST frightens
you so, you have no buisiness touching a PC. Give us a BREAK!

|
|| Memory Overhead: 5M vs. 300K
|
|If that was even slightly true, there would be no such thing as a 4MB PC.
|My best-ever time on Windows Solitaire was achieved on a 4MB 286.
The necessity of a swap file.
Coupled with system responsiveness that would be unacceptable
to an Atarianor Commie.
|
|I'll sacrifice some disk space for the extra functionality and bits and
|bobs, thank you very much. Disk space is cheap; functionality isn't.
|
It's also slower than core memory...
When one has been used to one's system bottleneck during execution
being a ns device, a ms device bottleneck is simply a step down.

|Frankly, constructing a pro-Falcon argument around the fact that comparable
|software (where it exists!) uses less disk space and memory would be funny
|if it wasn't so sad.

it's a pro-ST argument actually. In some instances, an ST is more
responsive than a 90Mhz Pentium, solely because of it's obscene
resource requirements. All but a relatively small minority of
users could have their needs serviced perfectly well by an ST
(let alone a Falcon). 500bux vs 2000 and a better engineered
system to boot.

Cheap disk doesnt mean a DAMN thing to me. I'd rather have more
RAM. More RAM is actually what is needed to get work done in
timely manner on a PC. PC software grows faster than system
resources. This always makes it a liablity in terms of resource
size and cost despite of your protestations to the otherwise.

|
|||If you could get 1024x768x256 with a Falcon, which you can't (and I couldn't
|||live with less), it would consume 768K of your valuable RAM. As it stands,
|||you can lose up to .5MB.
|| And gain it again if necessary just by changing your system resolution.
|
|Super! I never realised the Falcon had such a strong selling point.
More like the enviroment is such that 500K can be a significantly
useful computing resource.
|
|| Memory on a frame buffer card can only be used for that purpose.
|
|Well, I would hope so. This is why it's not counted when you talk about an
|8MB PC.
Too bad it cant be more usefull when your resolution wont eat it all
up with double buffering.
|
|| Also, bus contention is fun as well as underoptimizeable.
|
|My PC is set up just fine and works perfectly. If you're going to drag the
|bus into it, I doubt the Falcon can compete with PCI. And what were those
|dreadful revelations I was reading in this very newsgroup about Falcon SCSI
|problems..?
|
|PCs do have serious problems in certain areas, but there are a lot of people
|doing a lot of work and producing a hell of a lot of stuff for them.

1148. Pagestream/Stylus Drivers

Newsgroup: comp.sys.atari.st
Date: 1996-01-19 00:00:00 UTC
From: Royce.Lerwick@flight.org
Message-ID: <fc7_9601200106@flight.org>
Source record: 152526

Finally got done with the copy (text) for the DTP project I bought Pagestream for. Started futzing with it, and discovered a few pesky things so far:

1 It doesn't have a header/footer provision unless you set it up in text frames on the master page. The same is true for page numbering. That's fine, but then I finally found a way to turn off the master page in the document if you don't want the h/f/pages #, but then you get no page number or guide frames etc. So I've just been masking what I don't want with blank frames.

1.1 The other "right-out-of-the-box" thing you need to do is set printer offsets so it will print in the right position. Publisher, once again, right on the layout menue had an offset menue to set top and left margin offsets. The only way I can see to do this in Pagestream is by jacking around with the margin offsets themselves, which of course will leave all your onscreen tools and alignment guides screwed up, and if you spool out to disk to print elsewhere, or use another printer, it'll be on Mars. Any ideas? Is that "Special" line in the printer menue OK for sending printer codes?

2 It did *not* come with Epson Stylus drivers, and in spite of Toad's display ad claiming "Any Printer" I think the printer list is rather thin. I know Epson France was mentioned when I first asked and maybe some other sources, but did anyone ever get any Epson Stylus (800/300-or I think even the color drivers are compatible? from France or elsewhere? My son has been asking around too. Granted they do have an Epson 24 pin driver and it works, and the vector fonts and/or the driver is better than the Publisher package I was using before, but it still ain't 360/360 dpi.

I ran out and bought the hot new promise for all mankind in printers about three years ago now, and have yet to find drivers for it--drivers for the HP I brought back and traded for the Stylus because HP wouldn't also work with my other Epson-only cheap software, yes. Now the Stylus II is the big deal, and no drivers for that either. Ironic or what?

3 I also have a Migraph hand scanner, and so far the 300/400 dpi allegedly 32 level grayscale TIF files look like crap through the various viewers I've used and haven't yet printed out anything close to the photographic/newspaper quality I was hoping for. This may be due to the driver problem, as my

son printed some TIF/GIG files on his school's Mac and an HP 550 Deskjet that showed a lot more promise. I'm also guessing that only reproducing at the same size scanned will avoid all the dithering problems I've been warned about. Will reducing it damage the quality or is the problem mostly enlarging it?

4 Last night nothing (first time) on the "Style" menue would work. I highlighted some text, dropped down the menue, selected "bold" and it blinked but did nothing. It's locked into "normal." Turns out a very obtuse selection in the tag menue should be toggled to "no styles" which implies it *won't* accept styles, but it really means (since this function is implemented backwards) that the tag style will override all attempts to modify any text tagged with it unless "no styles" is toggled. "Normal" doesn't mean "normal unless modified by selecting and styling." It means "only normal and that's it." In short, if you want to make "bold" a word in your body text tag, you can't unless it is tagged "no styles." The manual is no help in guessing at this, and no sample or default documents are supplied to help either.

In short, the tutorial or the manual in whole is not very helpful in anything. (Hence you pay for the $39 online helper!) You would think it would right off talk about headers/footers and page numbers. Doesn't tell you how anywhere--you have to figure it out. You have to wing a lot of other things too, but at least it's fairly intuitive...

Any help or tips appreciated

I hate to be the one to tell you this, but a double sided drive
can read both single and double sided disks! So another single sided
drive won't help! Since 1986 I haven't seen a single case of head
misalignment, but I have seen quite a few with loose latch syndrome! This
is where the little knob that latches onto the bottom side of the floppy
disk has it's spring come adrift and no longer reliably keeps it spinning
at a steady rate! It is worse with some disk than others, seems to depend
on how easy it is to spin in the first place, on a tight disk the latch
will slip. You'll get a lot of read errors and data may be corrupted crap
from your ST! I fixed mine by making a new spring from one off of a
floppy door! Was only able to recover some of the disks written during
the drives illness though! Sorry to be the btinger of bad news!

I dont know of one...

>Failing that, an idea of how (if at all possible) this might be possible - I'm
>working on a computationally intensive program, and evry ounce of speed would
>be useful.

I doubt it would be possible, as the Falcon has fully programmable video registers,
and allows you to actually turn off the screen. This is what TurboBlanker does,
thus saving bus time (which is the main bottleneck on the Falcon). I'm not an
ST guru, but IIRC the ST has not got the ability to do this...

a> What exactly is Tex/LaTex ?
a> A lot of people seem to use this on unix machines.

Knuth, its originator, would have called it a computer typesetting system.

TeX, the base system, can be expanded by "macros" (e.g. LaTeX) to widen its vocabulary of typesetting styles and methods.

It accepts an input file which is mostly ASCII text interspersed with TeX statements which will control how it is typeset. The output is a .DVI file which is a device independent representation of the typeset text. With appropriate s/w this can be previewed on the monitor or output to any hard copy device for which there is a DVI driver.

On the ST two implementations are available PD. Those by Lindner and Strunck. There is a very good dvi package by Markus Pristovsek DVI_300 if you don't like the dvi processors which come with these two packages. You would also need the Metafont program which generates appropriate fonts.

The main competition are the high-end WYSIWYG DTP programs (CALAMUS etc.). Those "in-the-know" will tell you that TeX typesetting is superior to these even though usability is inferior.

If you have a copy of the Connect user manual you will see an example of TeX typesetting.

Try 'File Info and Program Flags' cpx (fileinfo.cpx) by Dieter
Fiebelkorn; as I recall in a package of 4 cpx's (the others are Show
System, Configure NVDI, and one other). Most programs (post 1990)
that will run from TT Ram already have the flag set, it is true. But
Mr. Fiebelkorn's cpx shows and changes the flags, as desired.

There is a port of X11R5 to MiNT. There are also ports of many Unix utilities for MiNT. Its a bit shaky though - but does work pretty well.

You need a hard disk and at least 4Mb RAM. An accelerator of some sort helps as well. NVDI/Warp9 etc is not used with X11R5 so you can't rely on that.

If what you mean though - is if MiNT can run program binaries from proper Unix systems - then the answer is no.

> Which one should I get? Any experiences?

I went for a DMA to SCSI interface and a SCSI CD-ROM.

Actually - I already had the DMA to SCSI interface (ICD AdSCSI+) as this is what was interfacing my harddrive.

I bought a surplus NEC CDR-37 (very basic single speed, single session CD-ROM) and the ICD Pro Utilities for the CD-ROM drivers. I believe than ExtendaDOS(?) is a better bet nowaydays.

> P.S. AT-BUS/TOS card seems good choice for 109 DEM in Germany.

Are you sure there are CD-ROM drivers for this card? IDE CD-ROMs are not 100% compatible with IDE Hard drives. Unless you have CD-ROM drivers it won't work.

IMHO SCSI is the *only* sensible choice for expanding the storage on an Atari.

BTW - what are you going to use a CD-ROM *for*? I bought one because it sounded like a good idea at the time(!) ;-) However apart from playing music - it does very little else.

AFAIK, the ST parallel port does not have the same handshaking as the PC,
it makes it difficult to use these type of peripherals.

For example, in order to use the DK600 Ethernet adapter (just an average
PC parallel port adapter) on the ST, the developers had to hack the
cartridge port to get the extra handshaking needed for correct operation.

This results in a project thats only for DIY Electronics type people &
then needs special software to use it.

Why go to all this bother for a parallel port tape streamer when you can
just get an SCSI device & ,assuming you already have the Host Adapter, get
a streamer that runs 2-3 times faster.

Parallel makes sense for the PC, because they all have one.
SCSI (ASCI) makes sense for the ST because it's a standard item.

There are peripheral devices that use the cartridge port (some CD-Roms &
samplers).

I guess the reason nobody ever bothered developing a parallel (or floppy)
based tape streamer was beacause it's fairly easy to get hold of second
hand SCSI parts like the Archiver Viper series.

Are you sure all the termination on the 2 drives are okay? I used to run
an almost identical setup:

MSTE4 internal 105Mb Quantum (ICD MicroSCSI)
External 40Mb Seagate (ICD AdSCSI+)

and it all worked fine.

Hello Jyri!

Do you mention COLOREMU.PRG by Bernhard Baier from 10.03.89
(written within the code), size: 2524 bytes? Short (german) documentation
is contained in the code of LOMIHI.ACC, both progs work together.
Recently I tried a little to patch it (needs ROM-TOS v1986) - no success.

Does anybody know a low resolution emulator for newer TOS versions?

: I know you need to tell TOS programs to use the Fast ram, so I was just curious.

On my system (4 MB ST RAM, 4MB TT RAM), I don't have to set any flags. It looks like the programs I run use TT RAM in preference to ST RAM, but I don't have any way of making sure. Anyway, no flags are necessary (or possible, I think, on a minixfs partition).

How to know not your versions of PGP been hacked, get some clean source and
compile it yourself or instead of PGP use RSA encryption and only use every
key just 1 single time. that will for sure asure you no MI5 in the world will
ever read anything you write/send on the net. just remember to choose big
prime numbers when doing the encryption.

"Esscode" does MIME as well as UUencoding and a list of other things,
but I've never been able to decode MIME messages myself.
I had to give up and ask the guy to send me a new mail in the normal
ASCII format.

UUencoding/decoding however works fine. I have no idea why MIME
doesn't work (or is so extrememly confusing to figure out).

Guy,
The basic packages for v5.0x, v5.5x, and v5.60 are similar. You
really need v5.60 if you're on a Falcon, for the Falcon-compatible
debugger and integrated editor. v5.60 also has a full make program
and profiling capabilities, so I would spring for it if you can.
However, I think you'd find v5.5x (I think 5.52) is satisfactory on
a TT or ST if you can live with a project-file type make instead.
v5.0x is pretty old and has some library bugs, although no big problems.
I wouldn't pay more than $20 for 5.0x.

I didn't know that but it doesn't surprise me, no governments like their
citizens having encryption. But I'm not sure what they can do about it
though, as neither the UK nor the EU have passed a law outlawing this kind of
strong encryption (yet) and there's no reason for them to stop us importing
something which is legal in this country.

Source record: 152636

I had a similar problem with my old 520. The drive didn't die, though, I upgraded to a different machine. I found that with the new machine, I could only read about half of the files on about half of the disks. I asked around to the few atari techies that I could find and the concurred on two things:
1) that some of the early st ss drives were buggy at best. This I experienced first hand. My drive would die for months on end. only to resurect itself and work "flawlessly" for a year or so. the process went on and on.
2) That the errors in reading my old disks were probally due to the drive either running slow or fast (probally both) or the head was out of alignment.
I offered a similar solution to the one that you are posing. The answer was that it would only work if the "new" drive was messed up in the *exact* same way as the old one.--A one in a million chance... I saved what I could with a disk editor, thanked god that my backup disks weren't all corrupted the same as the originals, and watched hundreds of hours worth of grammy-quality(g) midi file disk go into the reformat stack...

It will do it. I managed to do it fine through complete ignorance
until I read that you are supposed to specify the destination first.
Now I've got that stuck in my head, I haven't been able to get it to
do a thing with Mime since :-(

1184. Parallel Tape Drive for Mega STE?

Newsgroup: comp.sys.atari.st
Date: 1996-01-19 00:00:00 UTC
From: rrice@ccat.sas.upenn.edu
Message-ID: <4dn3cu$p2s@netnews.upenn.edu>
Source record: 152638

To whom, with anticipatory thanks...

HAS anyone come up with, or adapted, a parallel port tape backup system and driving software to the Atari Mega STe? I know that DBIII supports SCSI tape drives, but the parallel tape drives for DOS are selling for half as much these days, and I would like to back up my SyQuest to something else than floppies...

Most thanks,

Rob S. Rice
rrice@ccat.sas.upenn.edu

Hey all,

A week or so ago there were some posts concerning PGP. Anyway, there
was an article in this week's EE Times:

U.S. drops probe of Zimmermann

San Jose, Calif. - A three-year-long federal criminal probe of Phil
Zimmerman - an independent software developer who wrote the Pretty Good
Privacy (PGP) encryption package and offered it on the Internet - came to
a close last week. William Keane, the assistant U.S. attorney handling the
case, told Zimmermann's lawyer, Phil Dubois, that Zimmermann would not be
prosecuted. Keane did not provide a reason.
"My belief is the government decided not to prosecute for several reasons",
said Dubois. "First, Zimmermann did not commit a crime. Also, the government
didn't want to get involved in a big legal and policy argument - are you
exporting something if you post it on the Internet?"
Zimmermann plans to continue to work as a privacy advocate and computer
consultant.

Any spelling or syntax errors are my own.

> finally thought that Falcon _is_ the better computer, but PC has the
> better games. The result: he decides to keep and use both =) !

And why not. I bought my PC only a few months after buying my TT.
The reason was I was fed up not being able to access any of the vast supply
of PC software. OTOH the TT still did what I'd bought it for (GCC, MiNT
etc) - so I certainly wasn't going to sell it.

IMHO buying a PC certainly doesn't mean you are abandoning Ataris - not
unless you *want* it to mean that! ;-(

The following Atari ST Software is for Sale:

All are 3.50 disk, have original manuals, boxes, and are in very good condition. Prices are in American funds. Shipping included in price.

Lemmings ---------- $13
Megal Lo Mania * ---------- $13
Moebius ---------- SOLD!
Spirit of Excalibur + hint book ---------- $15
Ultima IV ---------- SOLD!
Ultima V ---------- $13

* Mega Lo Mania needs a boot disk that changes the monitor to a different MHz. I don't have this disk but I am sure one can be found on the Internet.

In <4dlob9$74j@badger.wmin.ac.uk> avsec@westminster.ac.uk (Philip Shore) writes:

>What exactly is Tex/LaTex ?
>A lot of people seem to use this on unix machines.

Not only on Unix, I assure you.

TeX is basically a typesetting language, dated from the time computers couldn't handle visual DTP. But now, in the time of Calamus and XPress, TeX seems to be popular as ever. LaTeX is a set of macros built on TeX, which allow the writer to concentrate on the text _contents_ rather than how it _looks_. You specify whether a new chapter starts here, this text needs to be emphasized or whatever, by the use of commands in the text rather than visually. At first this takes quite some getting used to, and having to trust a program the artistic decisions about your text layout is hard at first, but after a while you don't want anything else.

You can see it like this: In the old days, you just typed your manuscript on a plain typemachine, and sent it to the printers, with some comments here and there: `This should go in a box', `A picture goes here', `This should be bold' etc. The printer knows exactly how much text you can put on a page to keep it optimally readable, how much spacing should go between lines, what typefaces combine nicely, what typographical errors should be avoided etc. So once you've taken the (big) step of admitting you don't know these rules, trust LaTeX to them and write your manuscripts the old way, with commands through the text (starting with a backslash \), and `compile' them with TeX for typographical correct results. For example, you say \chapter{Introduction} where you want to start a new chapter titled `Introduction'. LaTeX will select the correct font, keep track of the numbering, start a new page (if typesetting a book) etc. All these parameters can be set.

Especially is you use lots of mathematical formulae, TeX/LaTeX is probably the best you can get. And it's free.

Mind you, lots of people will probably tell you to avoid it, saying it's arcane and arrogant (TeX, that is, making typographical decisions for you), and the time of typing commands is over.
But I rather think it's arrogant that people not knowing sh*t about typography just merrily click away on their DTP software, combining _awful_ typefaces with lots of frames and shadow effects, composing documents that are nice to look at form a distance but give you a headache to read. I'll stop now, or we're going to have the same flamewar as some time ago...

If you want to know more, post again or email me.

Regards,

>have any docs with it. Running the Install.prg copies the SYS driver file to
>my GEMSYS folder, copies the CPX to my CPX folder and then modifies my
>ASSIGN.SYS ...

Yes I agree with this, I played with the .SYS and CPX last night but found
that the rest of machine was very unstable, locking up, can't select icons ...:

I've got an ST with TOS 1.4 with NeoDesk and XCONTROL.ACC for the CPX's
and use GDOS 1.1 to load the assign.sys.

Works fine without the CPX and .SYS in !!

Could it be some problem with this setup ??

p.s. It would be very nice if the author or someone else could put up a
ENGLISH version.

Mike

>it needs _that_ amount of resources.

An excellent, excellent point. MS software could care less about
the user's cost of running it.

And in your similarly specified Pentium, did you include midi
interface? What did you provide that was to be the equivalent of
the 32MHz DSP? And what provides the switching flexibility on
the DMA bus to re-route inputs, memory, DSP and outputs as we
have on the Falcon that allows amazing flexibility. (Since you
may be thinking the dedicated sound blaster support is the DSP
equivalent. If so, how will the sound blaster provide "modem"
support? How will the soundblaster provide graphics enhancement
capabilities - or maybe you were using an even faster pentium to
achieve that?) And the scsi interface? And the 4 game ports?
And the graphics card that can do at least Atari True Color?

Most IBMers don't understand the Falcon architecture and Atari
programmer philosophy's. But you can buy whatever machine
suits your purposes. It doesn't make one better or worse than
another - only better or worse for an individual person.

but MIME isn't used much for distributing software (yet, I'm sure it will be). The whole point is that it should provide multimedia email. Of course I can save the message, run a separate decoder and then launch the viewer, but it would be nice to have it integrated into a mail reader. Actually, didn't someone port pine to MiNTnet? That supports MIME.

1195. SF Chronicle Atari article

Newsgroup: comp.sys.atari.st
Date: 1996-01-19 00:00:00 UTC
From: markvanwyk@aol.com
Message-ID: <4dntah$cco@newsbf02.news.aol.com>
Source record: 152649

This article appeared in the Thursday, Jan. 18, 1996 business section of the San Francisco Chronicle:

Atari May Play a New Game

Michelle Quinn, Chronicle Staff Writer

Atari Corp., the Sunnyvale video game pioneer and the maker of classics such as Pong and Pac-Man, plans to get out of the video game business, according to Multimedia Wire, a news wire covering interactive entertainment.
Citing sources at the company, Atari will liquidate all video game assets,

including its Jaguar line and its small software division.
The story said 20 people already had been laid off.
Instead, Atari will join the trend of making games solely for the personal

computer market. The company announced this year it was making computer games as well as its video games.
August Liguori, Atari's chief financial officer, denied the story.
``We are not getting out of the video game market,'' he said. ``It's a part of
our history and it will continue to be part of our history.''
But Liguori said the company had ``made structural changes in how we are moving forward in the video game business.'' Liguori would not elaborate on the company's plans.
Atari's stock dropped 5/16 yesterday to 1 5/8.
Since it was founded by Nolan Bushnell in 1972, Atari virtually created the video game industry with home machines and games such as Pong and Pac- Man.
The company nearly collapsed in 1983 and has since seen its sales fall to $38 million in 1994, down from $500 million in 1987.

According to Multimedia Wire, the Tremeill family plans to merge the company with a computer components manufacturer, although the merged company is expected to trade under the Atari stock symbol.

Help.

I am using the Mydial extensions for resources, as supplied with
Interface, in OASIS 2. Unfortunately, the person who compiled the C code for
use with GFA basic left out eh access to the 3-D dialogs functions.

What I need is someone with Pure C or Turbo C who can recompile the
source for me. I know what needs changing, and have amended the source, but as
my C experience is limited it may be wrong.

Any one who can help please contact me via e-mail.

Thanks in advance.

No, 10.5MB. I said "including".

> Nevermind the fact that it's a DTP and NOT a wordproc,
> comparing to Pagestream.

Lotus describe it as a word processor. It has DTP features. So much so
that I don't really need Pagestream, but I happen to prefer it - ah, the
luxury of choice.

>|I don't know of any ST C compiler which offers full GEM libraries and a

Comes on 7 disks, so how can it install in only 1.5MB?

>|I upgraded my STE from TOS 1.6 to 2.06, and I'd rather not go through
>|that again, thank you very
> If the single most trivial upgrade inside of an ST frightens
> you so, you have no buisiness touching a PC. Give us a BREAK!

This was the switchable upgrade, because I still wanted to run some of my
old software. It took so much force and so much time to push the board
into the sockets that I could never be sure it wouldn't pop out suddenly,
although it hasn't so far. I also had to drill a hole in the case for a
switch. So this is the most trivial ST upgrade, is it?

Replacing the fan in my PC's power supply was a breeze by comparison.

> The necessity of a swap file.
> Coupled with system responsiveness that would be unacceptable
> to an Atarianor Commie.

Think so? Well, get this. 29% of all new home PC purchases in the UK
last year were replacements for Ataris or Amigas.

>|Let's just see who can still find new software for their machine in 5
>|years' time, shall we?
> What new software have you really needed in the past 5 years?

Doom. Netscape Navigator. Free Agent.

> What really software has even been released in 5 years?
> Not bloody much.

Doom. Netscape Navigator. Free Agent.

Do PC owners fill their newsgroups with bitching about machines which they perceive to be inferior? No they don't, because they've got better things to do. Come to think of it, so have I.

In comp.sys.atari.st, trek@ihgp114r.ih.att.com (-Booth,W.A.) wrote:
>And in your similarly specified Pentium, did you include midi
>interface?

Yep, included in the sound card. To be honest, I prefer the
ST's MIDI support, which is why I've kept mine.

>What did you provide that was to be the equivalent of
>the 32MHz DSP? And what provides the switching flexibility on
>the DMA bus to re-route inputs, memory, DSP and outputs as we
>have on the Falcon that allows amazing flexibility.

This was a nice feature of the Falcon. I'm not likely to need a
DSP myself, but if I did, I could buy one on a card and plug it
in. My Pentium setup with a DSP card would still be cheaper
than a corresponding Falcon, I'm sure, but there would be
precious little software which took advantage of it.

>(Since you may be thinking the dedicated sound blaster support
>is the DSP equivalent. If so, how will the sound blaster
>provide "modem" support?

It won't. Yes, whatever did happen to that software modem? (:

>How will the soundblaster provide graphics enhancement
>capabilities - or maybe you were using an even faster pentium to
>achieve that?)

Not necessarily. Doom ran just fine on a 486/33. If the DSP
really gave graphical enhancement comparable to the brute force
of a pentium, there would be no doubt whatsoever that a Falcon
Doom clone was possible.

>And the scsi interface?

If I need one, I'll buy one. But I won't need one, because
there's a CD ROM built-in - another thing which would push the
Falcon's price up even higher.

>And the 4 game ports?

I don't think I can go past two, unless there's some fancy
gadget I haven't yet come across, but I really can't think of
many games which allow 4 simultaneous players on the same
machine in any case.

>And the graphics card that can do at least Atari True Color?

Will 640x480x16 million do?

To create an absolutely identically-specified Falcon and PC, it would be necessary to take bits away from each and add other bits to each. (And on both sides, some of these modifications just wouldn't be possible.) It's left as an exercise to the (potential) owner to decide which bits are really important.

>Most IBMers don't understand the Falcon architecture and Atari
>programmer philosophy's. But you can buy whatever machine
>suits your purposes. It doesn't make one better or worse than
>another - only better or worse for an individual person.

Absolutely.

RE: Dungeon Master 2 on the PC

I thought it was pretty good, although other Dungeon Master fans disagreed.

It maintained the flavor of the original while adding more updated features.

RE: Port of Dungeon Master 2 for the Jaguar

It'll never happen.

I don't seem to remember anything about 2-way data exchange in Centronics
printers, which kind of define the interface (I don't think there's any
kind of standard covering parallel ports, but if there is I very much
doubt it includes bidirectional support either)

Bidirectional parallel ports were invented for the PC, and not the early
PCs either. Actaully the Atari's parallel port can be used bidirectionally
to some extent, but isn't as flexible as that of the PC, or compatible
with it.

I thought I read that the Falcon printer port was fully
bi-directional. Isn't there a hardwrae hack to do this on other ST's?

Mark Baker (mnb20@cam.ac.uk) wrote:
:
: The underlying operating system, TOS, is rather nasty and MSDOS
: like, but you can install a patch called MiNT that gives it
: multitasking, proper filesystem support etc.
:
: As for alternatives, Magic is a replacement that is faster and
: multitaks well, but is compatible with it. You can also install
: linux.

Geneva is my choice ;-)... Well, there are many alternatives around. They all can use more or less the same programs, but differ mainly in their ability to run many programs simultaneously. If you don't need this ability, you can well live happily with TOS/GEM as it is now =) !

I'd advice you _not_ to get WARP 9. If there's ONE enhancer program you should choose - go for one called NVDI 3 (or 4) ! It accelerates your computer enormously, gives you scalable high-quality fonts to use, and is very reliable and harmless in use. VERY excellent, I think !!!

These kinds of utility programs can be very helpful, and improve your computer more than one might ever guess. Still, they sometimes cause trouble, too (not NVDI - but some others) - so don't be tempted to try all sorts of system additions before you really know what you're doing.

Cheers,
Tommi

[....]

>Has anyone got an old low density drive mechanism I could try swapping into
>the 520?

I can't help you with the drive itself, but I have made available info
on how to install a HD drive in an ST which also lets you use HD
(1.44MB) disks if you add a small electronic circuit (and possibly
change the drive controller for an "AJAX" type).

Other than that I have mine running fine as a 720K drive- it's "HD
ready", and will be fully HD compatible when I install the HD module.
I'd suggest you to install this kind of drive even though you might
not need HD right now (or later) as I suspect DD drives to be harder
to find (just my thoughts though....).

If you want to check it out, FTP to:

ftp.sn.no /user/hallvart/atari/sony_144.zip

As for data recovery which you also asked about: try "Chkdisk3" from
Atari- it's available in several FTP sites. Among all it's functions
it's got a recovery feature which i think should work with floppy
disks as well as with harddisks.

Are there any "notepad" or "scratchpad" type CPX modules around?

It would be handy to have something within immediate reach at any time
where you could jot down small messages etc. and store them as a text
file. I'm not looking for anything fancy- just a very basic notepad.
Anything like that around?

Hallvard

1227. Re: **Problems installing STiK on Falcon

Newsgroup: comp.sys.atari.st
Date: 1996-01-20 00:00:00 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <4drd38$dn1@charm.magnus.acs.ohio-state.edu>
Source record: 152432

You don't have carrier detect turned on. Or at least that's part of the problem. GGo into the dial script and put &c1 into your modem init. Then put Carrier detect = True as well. That should make it wait till it dials.. The port should be set to modem 2 as well on the falcon. Try those out and see what happens. If it still doesn't work, there is probably something else wrong in the dial script.

1230. **Problems installing STiK on Falcon

Newsgroup: comp.sys.atari.st
Date: 1996-01-20 00:00:00 UTC
From: "Chridtopher J. Rider" <cjrider@students.wisc.edu>
Message-ID: <31009CC0.5D1A@students.wisc.edu>
Source record: 152435

I'm having (as the title suggests) problems installing STiK on my friends Falcon. (I'm a Mac person myself, so these questions may seem a bit innane to any real Atari user..)

The computer starts up O.K., and the dialouge box looks about the way I would expect, but when I ask the computer to connect, it doesn't seem to be addressing the modem. It appears to skip the "dial" portion of the script, and looks immediately for the login prompts...

As i said, I really have no idea what i'm doing on the Atari... any help would be appreciated (by me and my friend...)

1231. Atari & Internet HELP!

Newsgroup: comp.sys.atari.st
Date: 1996-01-20 00:00:00 UTC
From: mourikis@athena.compulink.gr
Message-ID: <4drgvp$93s@news.compulink.gr>
Source record: 152436

I use a PC for logging into internet from my job, but i want to use my
atari for this purpose from my home.
Is it possible?
My configuration is:
1040ste with 1mb RAM, no HD.
I am not sure about the stos version.

What minimum hardware and software do i need?(except modem)
Where can i find comm programs?
Is there any nice person out there to give me these valuable informations?

I also have an old monochrome PC screen (not VGA). How could it be connected
to my atari if so?

Thank you in advance
Tasos

1232. Re: 1040 Power Supply specs?

Newsgroup: comp.sys.atari.st
Date: 1996-01-20 00:00:00 UTC
From: tronshop@pixi.com
Message-ID: <4dpo5j$j34_001@pixiuser.pixi.com>
Source record: 152437

The specs I have here are 5 volts @ 3 amps and 12 volts @ 1.6A

I've found that the Electrotlytic Capacitors C14 and C15 are the parts
that fail most often. I usually replace all four caps in that area,
2 - 330mfd 35v, 1 - 2200mfd 16v and 1 - 4700mfd 16v.

I've also found that if R2 and/or R3 (both are 150K ohm .5 watt) are
open it will either blow the fuse or it won't work at all. If it is
blowing fuses you will need to make sure that the full wave bridge
rectifier is still good.

If the power supply shows signs of over heating in the middle of the
board it might be a lost cause. Some signs of heating up is normal,
but, when the board is darkened and the outer coating of the power
resistor is peeling, well then, its just a matter of time.

Also check for cold solder joints, I've also found this to be a problem
especially with those that are left on continuously.

I hope this helps. I have given more info than requested because I
know that these power supplies are becoming harder and harder to find.

Later

Dave

Well, here it is a second time. I've lowered prices on some stuff, and
added a couple of new items. Prices do not include shipping.
Minimum charge is $5.

Hardware:

=> SM 124 Monochrome monitor $30

=> Golden Image DS/DD Disk drive (unreliable). Includes power supply,
cable, and manual. $5

=> DS/DD Drive in SF 354 case (unreliable). Includes power supply and
cable. $5

=> External 520 ST power supply. Only one year old. $5

=> Spectre 128 Mac emulator, including Mac ROMs and 3.0 upgrade. $25

=> Mouse Master mouse/joystick port controller. $5

Software (all come with manuals and original disks)

=> Timeworks "Partner ST". Includes calculator, Address/phone list, Alarms,
Memo Pad, Planner/Calendar, Expense Manager, Disk Manager, Vital
Statistics, Thesaurus, and a game. Comes in the typical Timeworks
professional binder. $5

=> Timeworks "Desktop Publisher". Create newsletters, flyers, reports,
catalogs, presentations, brochures, manuals, etc... $10

=> Publishig Partner Desktop publishing. Includes Partern Fonts #1. $5

=> Springboard's "Certificate Maker". $5

=> Intracorp's "Business Card Maker". $5

=> Print Master "Art Gallery I" and "Fonts & Borders" with upgrade
to PrintMaster plus. Includes original PrintMaster disk (no manual
for PrintMaster). $5

=> Migraph's "LabelMaster Elite". $5

=> Clip Art Disk #5 (Zoo, Menu, Outdoor, Theater) Degas Files. $3

=> Atari's Neochrome. $5

=> Antic's Cyberpaint 3-D animator. $10

=> Migraph's "Easy Draw" drawing program and
"Easy Draw Personal Draw Art 1" pre-drawn pictures. $5

=> Activision's "Paintworks". $5

=> DMJ's "View II" desktop replacement viewer. $4

=> California Dreams "Vegas Gambler". Slots, Blackjack, Poker Roulette. $5

=> MichTron's "Juggler". Run up to seven GEM programs at once. $5

=> DTACK's "DBASIC". $7

Books (Free)

=> "Atari ST Graphics and Sound Programming" by Henry Simpson.
For use with Basic. Two copies. Free

=> "The Atari ST for Beginners" from Abacus. Free

=> "Compute's 1st Book of Atari ST" from Compute!.
For use with Basic. Free

=> "Atari ST Graphics and Sound" from Abacus.
For use with Basic. Free

=> "Word Processing Primer" by Waite and Arca. Free

Other (Free)

=> "Beginners Guide to the Atari ST" VHS Tape, by Bill Skurski. Free
=> Original Disks with no manuals: (Free)
-> Pierstorff's "More! Graphics"
-> Michtron's "Flip Side"

If you're interested in any of this stuff, please respond via email
or call me at (708)303-0964.

Source record: 152444

There were several different models produced for Atari. The very first
one was made by JVC, it had a removable video cable and its controls are
on the lower right hand corner in front of the monitor. The second one
was made by Goldstar and the controls are on the right hand on the side
of the monitor. The third one was made by Samsung and its controls are
on the lower left hand corner in front of the monitor. These were all
had the numbers SC1224 on them. If you can tell me which one you have,
I might be able to scan the schematic and email via uuencoding, or you
can contact Toad Computers and they might be able to point you in the
right direction. Just remember to let them know which model you have.

So all worries are over, use PGP freely and don't worry about whether it
is legal or not.

Personally I expect to see an upgrade to PGP pretty soon, seeing as Mr Zimmermann is now a free person again!!!!!

TTFN

> Does anyone have any suggestions for data recovery?

A few years ago, I noticed the beginnings of problems like you
describe above, and ran a disk checker utility (I forget which one.) It
turns out that my drive was spinning at 302 or 303 RPM instead of the
standard 300 RPM, and that was enough to screw things up.
My solution was to box up the ST for a few years and let it rest.
I'm now buying a better ST and using the old one as a dumb terminal.

Hello, everybody!

Several have remarked on the pleasantness lately in csast, the courtesy, friendliness and helpfulness. I have also noticed this, and add my voice in approval. Another mentioned that it was always the same people answering the same questions. Actually, I am surprised at the number of people who add their voices to this group every day, and the variety of questions to which I don't know the answers. Seems like we are growing, even though the Atari market is shrinking.

I am not a programmer or technician, and in fact am pretty hopeless about *ever* getting in front of the curve. However, I am a fairly good program runner, and a hardware junkie who, nonetheless, has a difficult time adding peripherals. When questions pops up in csast, I answer all that I can; this usually limits me to very few. I try to answer by email, rather than in the newsgroup itself, unless I feel that the answer is of interest to others. I invite the lurkers out there to post their questions to the newsgroup, or email them to me (especially newbie questions - I really shine when asked why there are two floppy icons, but only one drive :) I also do well with 'why should I back up...' and 'why should I write-protect....' Been there, done that.) I do this in the hope that when I ask my questions, the knowledeable ones out there will take the time to answer them.

Ask away, folks - if it is a question I can answer, I will!

"The Poor Deluded Soul" - tderrick@acpu.com

... Confusion IS my natural state of mind, thank you.

For Sale Mega 4 STE, Tos 2.5

Detached keyboard

100 meg internal HD

in nice shape really hardly ever used.

Hardware consist of:

Original Tos 1 chipset in static proof sleeve.

Color and Black and White monitors

Syquest 44 Meg removable drive in external case with ICD host.

2 Waco Boss joysticks for games.

Of course all cables and power supplies.

Thrown in. one meg expanded original 520 ST with external DS
drive -

drive can be used second drive on Mega ST.

Software consists of:

Ratsoft BBS/BBS Express

Mark Williams C compilers and Debugger

Cyber Cad 3.o , The pawn, Mean 18, Dungeon Master, etc.

LOTS more not listed

Mags and disks

Various ST subscription magazines with disks (whole box full)

All equipment works (Did at lest a few months ago, last time I
booted it all up!)

THIS IS FOR SALE AS IS. I can't guarantee anything that is
several years old, dugh!

=-=-=-

of good stuff in here. I want to sell it all at once but will consider breaking some of it up

if the price is right. I'll even throw in shipping for the right offer. Contact me at my

internet address, since I no longer read this newsgroup.

-A52116@AC3

Hi Mark!

MB>A german magazine mentioned something called MultiTeX apparently also
MB>by Lindner, it appeared to be a really nice system with a GEM based
MB>previewer, but I'm not sure what the distribution conditions were and
MB>I've never seen it in a UK mag or found it on an ftp site.

There you are wrong: MultiTeX was written by Christoph Strunk. It is distributed by Maxon (only in Germany, I think). It is a very good TeX-system and, yes, it has an GEM based previewer. But although the name implies a system capable of multitasking, the shell overlays itself by the editor, viewer, or whatever you called. Perhaps the newest version has some improvements - I don't know.

The price of that system is 75 DM. I doubt if it would be very useful for you since all the documentation is in german.

cu
Torsten

PS: Excuse me for my bad english.

1249. MagicMac on 8500 crashes..

Newsgroup: comp.sys.atari.st
Date: 1996-01-20 00:00:00 UTC
From: Petr Jandik <jandik@login.cz>

Hi all,
I've been trying MagicMac on Power Mac 8500. The MagicMac
itself crashes very frequently, also during such principal
operations, like copying etc.
Did somebody tried to run Magicmac on 8500 or 9500? What's
your experience?

Petr

1250. HELP SAVE ATARI -- Please Read!

Newsgroup: comp.sys.atari.st
Date: 1996-01-20 00:00:00 UTC
From: brettf@izzy.net
Message-ID: <4drnsa$avo@izzy4.izzy.net>
Source record: 152555

Atari is in a state of turmoil. I know that many of you LOVE to flame Atari, but the person (or persons) that SHOULD be flamed are the Trramiels! Don't!!! Tell them EXACTLY WHAT YOU THINK. Atari has been with us for 25 years, from Nolan Bushnell to Jack Tramiel to Sam Tramiel to ?????. Atari INSPIRED the video game business. If it hadn't been for the ATARI we used to know, video games wouldn't have come around until 1990 or so. Even back in the early days of video gaming history, Nintento's owner approached Atari to market the NES. True, Atari has made some stupid moves over the course of history, but without them, where would we be???

If there hadn't been an Atari VCS, where would the Intellivision, Colecovision, NES, SNES, Sega Master System, Genesis, VideoMax, Saturn, CD-i, 3DO, GameBoy, GameGear, PlayStation, and Ultra 64 have come from??? Sure, the respective owners could make them, but Market Competition speeds development, and without Atari being there, there would have been LESS PUSH! Some of you would tend to disagree, I know, but here is a small list:

Atari spawns the: Atari 2600 VCS

others follow: Intellivision, Colecovision, VideoMax, NES, SNES, Master System, Genesis

Atari spawns the: Lynx Handheld Game System

others follow: GameBoy, GameGear, VirtualBoy, Nomad

Atari spawns the: Jaguar

others follow: Saturn, 3DO, Playstation, U64

Now, I'm not sure about the 3DO part, but the rest I'm quite sure followed Atari.

I'm NOT SAYING that ATARI IS THE BEST! What I'm saying is that, with the lead on innovation, NEWER and BETTER products followed. If Atari were to shrivel up and die (as it seems they might) I'm sure that a few would CHEER, but there are many more that I'm sure would see the END OF INNOVATION and the eventual death of video gaming as we all know it!

********** IMPORTANT **********

I am asking that you read the article below. I am asking that you "DO THE MATH" and see what is to become of the video game industry. I'm asking that you HELP US and YOURSELVES and tell Atari NOT to leave the video game business, or, SELL Atari to someone who could carry on the name and make it GREAT again!!! Fax Atari, send them e-mail, send them

snail-mail!!! Here are the addresses and numbers:

Jack Tramiel, Chairman of the Board
Atari Corporation
1196 Borregas Avenue
Sunnyvale, CA 94089-1302

Fax: 408-745-2088

Phone: 800-GO ATARI

e-mail: atari@aol.com - General Customer Support
75300.1267@compuserve.com - Don Thomas (Dir. of Customer
Supp.)

Now, read this article, visit rec.games.video.atari and search the net
and SEE for yourselves what is going on!

```
Can anyone tell me where in europe I can buy the Afterburner 040, how
much I have to pay for it, and where I can get some more specifications:
-which kind of CPU i get (LC or full FPU)
-can I easly replace it with 68060 (is it mounted in a socket?)
-is the system able to run with 68060
-which kind of SIMM I have to put in to it
and may be some other info

thx,

Simon.

>newgroup:
>
>Are there are mail, usenet and WWW browsers available ?. If so, where ?

Yes!

Oasis 1.35E is an off-line reader for e-mail & Usenet groups. It uses the
NOS package (included) for all on-line work. Future versions promise to
replace NOS with a new package. The Oasis/NOS package also allows FTP &
Telnet access.

A WWW browser & IRC client (server? I get mixed up with technobabble :o])
is available as WWW116.

Both of these packages should be available from the atari folder of most
major FTP sites. Hensa & Umich jump to mind. BBS boards may well have them
as well.

1255. Falcon fakes interlacing

Newsgroup: comp.sys.atari.st
Date: 1996-01-21 00:00:00 UTC
From: Timothy Miller <millert@csee.usf.edu>
Message-ID: <Pine.SUN.3.91.960121144057.28012A-100000@grad>
Source record: 152455
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hey, I'm kinda confused about something...

Today, I connected my Falcon to a TV so I could get 640x400 TC screen mode.

When I put the Falcon in a non-interlace mode, I got a non-flickering picture, and when I looked closely at the TV screen, there were the familiar gaps between the scanlines that I remember from using an 8-bit or ST on a good TV or monitor.

When I put on a TV station, I get a non-flickering picture, and when I look closely, there are no gaps between the scan-lines.

When I put the Falcon in an interlacing mode, the picture flickers badly, and when I look closely, there are gaps between the scanlines. (I looked at images both with high and low contrast)

Now, I remember looking at an Amiga with interlace. If you watched a single pixel on a vertical line, it would appear to be rising, because of the alternating sets of scanlines. I did NOT see this in the images from the Falcon. After staring at it for a little while, I began to realize that the scanlines were not in fact being interlated at 60 fields per second, but instead were simply being ALTERLATED at 30 fps.

WHAT'S THE DEAL? The Falcon doesn't really interlace! It just fakes it!

If you haven't written anything else to the partitions, I believe ST Tools had an undlete function. However if You have written to the disk you will need something stronger. KnifeST (predecessor to Diamond Edge) can do it, but you have to do it by hand and you may not get back everything.

>of Pinhead that will work on the Falcon.

I used to use Warp9 as my screen accelerator, and the Falcon version has PinHead built in. It would load PageStream in about 15 seconds, a FAR CRY from loading it WITHOUT PinHead, eh? Unfortunately, PageStream is very modular and each module is seen as a separate LOAD by the computer (or so it seems to me, at least) hence it has to do the MEMORY CLEAR process for each module. (PITY ME! My 14Meg Falcon requires about 90 seconds to load PGS, and that's on a 32MHz accelerated machine!)

Sadly, the only stand-alone version of PinHead I've ever seen was created for use on the 68000-based ST so it doesn't take advantage of the 68030's caching. Now that I'm using NVDI instead of Warp9, I _REALLY_ miss that '030 version of PinHead in Warp9. Still, running WITH PinHead is better than running without.

That's my experience on the subject. Sure hope someone has a better answer!

ST tools does not like my HD - personally I wouldn't trust it. There is
an undelete function in a program written by Atari that seems to work
fine (and fast), it also hasn't recked my HD in yet. I think it's called
CHKDISK or CHKDISK3. It should be on umich.

: J0X 2Y0 (819) 647-6022 : And no religions, too

The Atari Mono (SM124) monitor might not be dead. Sometimes the potentiometers for the brightness and contrast, found on the side of the case, develop moisture related corrosion and gunk build-up. If you don't have access to a proper industrial grade spray cleaner, try WD40: it stinks and makes a greasy mess, but usually does the trick. Try to spray the metal bits in behind the plastic knobs. Also there are 3 trim potentiometers inside, which will also cause the monitor to malfunction if they have bad contacts due to moisture. The WD40 trick works on these as well, but you have to be VERY CAREFUL not to touch the wrong capacitor. Don't want a really bad shock, do you?

You need to hang on to at least one SM124, SM125 or SM147 monitor. These display at 640 x 400 pixels, which is known as ST HI-RESOLUTION. Many serious business software packages written for the ST required this resolution level. I use Calamus a lot, but this really needs 2 mB of RAM to work properly.

No, I don't think Atari have been naughty. They've done exactly what they
should. When you switch on there is ROM mapped to addresses starting at
zero, as well as in it's normal place at E00000. The cpu starts by jumping
through the vector at address 4 (and loads the SP from address 0) and
that points it into the ROM at it's normal address at E00000. The first
thing the code there does is to unmap the ROM from address 0 (I'm not
sure exactly how Atari have implemented this, but one method is to have a
flip-flop which is triggered by accessing a particular port) and copy the
vectors from ROM into the RAM that is now mapped at address 0.

That's what Motorola recommend, and it's what Atari do. I can't think of
any other method that would allow the vectors to be changed.

>the RAM. Has Atari been naughty again?

AIUI at some point during startup the ROM code is copied to RAm and then
the rest of the code from then on is run from RAM. I was told this this
was so that different parts of the OS could be patched or enhanced etc.

Any DD PC drive should work on an ST but you will have to cut a hole from around the disk drive for the new size buttons. 1.44 drives can be added fairly easily but you will need to change the clock speed on your drive to cope with it, this can be done either by youself with a new chip and things or ou can get a ready made board and driver software that needs about 10 wires to be souldered to your WD1772 chip, the drive and your motherboard. I used the ELCO drive kit which works really well with Tos 2.06 but I think Toad will have it so give them a call.

Also from what I hear (I STILL haven't recieved my stuff yet :-( ) the
background DMA functions are only actively supported by HDDriver 4.5 and above
and if you use them with a driver which does not support them then you may have
trouble.

Hey people can we just stop this eternal argument about which machine is better - its getting so sodding boring wading though all the same old tired arguements.

The ST-TT-Falcon have their limitations and faults
The PC system has its limitations and faults.

Neither system is perfect but neither system is total garbage, each has its own niche areas (Midi and HD recording etc).

The argument that there will be no new Atari software in 5 years is a non-starter as there won't be any new Pentium specific programs in 5 years either as both the M68K series and the Ix86 series will be totally obsolete by 2001.

OK the Atari is starting to show its age but then again so is the Mini.

Enough, I'm off to listen to some LPs

Steve

A > any thing that would help. Is there any version of Pinhead
A > that will work on the Falcon. Thanks. Raymond

Well, sorta. The CodeHeads included the PinHead code into Warp9
sometime before they did the last version, 3.81, which supposedly
works on the Falcon. I do not know whether they ever made a PinHead
version that did. Did you try v2.1?

Btw, several people have expressed a preference for NVDI over Warp9;
they are probably right. But Warp9 has been very good to me, and I
hate to discontinue its use. (Sticking up for ol' favorites!)

> it still ain't 360/360 dpi.

There's an Epson Stylus Color driver on GEnie that works fine with the Stylus Color II printer. (At least it's working for me, I just got my new Stylus II two days ago.) Couple of things are noteworthy: It's kinda shakey about fill density patterns in that sometimes a 10% fill will print fine and at other times 10% is ignored. (This is only in 720 mode, works perfectly in 360 mode.) Also, in 720 mode my 14Meg Falcon can take upwards of 45 minutes (!) to print a page of normal density. That's pretty slow by ANY standard, and worse it takes upwards of 3 "passes" at the Creating Page process. If the printing stops in the middle of an object with a fill pattern of 10%, the pattern may/may not be the same when printing resumes. Don't know if this is a problem with the 1) printer, or 2) the driver, or 3) the program.

Nonetheless, when the final output is compared to other printers I've tested with PageStream, the Stylus Color stands heads and shoulders above the rest.

BTW, the file on GEnie is called EPST205.LZH, and is located in the PageStream roundtable.

1281. Falcon fakes dithering

Newsgroup: comp.sys.atari.st
Date: 1996-01-21 00:00:00 UTC
From: Timothy Miller <millert@csee.usf.edu>
Message-ID: <Pine.SUN.3.91.960121001803.15058A-100000@grad>
Source record: 152564
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hey, I'm kinda confused about something...

Today, I connected my Falcon to a TV so I could get 640x400 TC screen mode.

When I put the Falcon in a non-interlace mode, I got a non-flickering picture, and when I looked closely at the TV screen, there were the familiar gaps between the scanlines that I remember from using an 8-bit or ST on a good TV or monitor.

When I put on a TV station, I get a non-flickering picture, and when I look closely, there are no gaps between the scan-lines.

When I put the Falcon in an interlacing mode, the picture flickers badly, and when I look closely, there are gaps between the scanlines. (I looked at images both with high and low contrast)

Now, I remember looking at an Amiga with interlace. If you watched a single pixel on a vertical line, it would appear to be rising, because of the alternating sets of scanlines. I did NOT see this in the images from the Falcon. After staring at it for a little while, I began to realize that the scanlines were not in fact being interlated at 60 fields per second, but instead were simply being ALTERLATED at 30 fps.

WHAT'S THE DEAL? The Falcon doesn't really interlace! It just fakes it!

>Ghostlink transfers both ways with no problems....

>I just wish he had released the parallel port version

>--

Myself and a friend have recently written a parallel port file
transfer program.
The program should work between all Ataris and PCs with a
bi-directional parallel port.

It has been tested:-
PC<->Falcon
STE<->Falcon
Falcon<->Falcon
PC<->PC

It is not as elagent as Ghostlink as it does not re-map the PCs drives
onto the Atari (we don't know how to do this:-), but it does have an
interface or command line version on the Atari end, the PC end just
has a command line version.
It is also faster (being parallel), and can be used between more
computers.

If some of you are interseted in this then perhaps I could tidy it up
and post it?

And if anyone has code to get virtual drives on the Atari desktop,
(or the PC for that matter) then we could hopefully churn out a good
version.

Yeah. But in fact, the vectors can't be changed. They are always mapped to
ROM. The ROM code however accesses a system pointer which can be changed.

Money is the bottom line here. It *is* expensive to maintain two different achitectures. However there is some overlap between my TT and PC. On the hardware its the external SCSI devices, 17" monitor and printer. On the software side its Linux. I might need two sets of binaries - but often work done on one of the machines is relevant and useful to the other.

> People just have limited time and money resources; few people want
> to maintain and learn two different systems.

Working in the computer industry - I feel I need to keep my skills up to scratch. The TT isn't bad at this. I can do C, C++, Unix and X11 stuff with it. However the PC covers many of the other areas. Also in interviews its much easier just to pretend I have 2 PCs networked together under Linux - rather than a TT under MiNT and a PC under Linux/pc! ;-)

:-)

Roland.

You need a FastRAM board first, which you plug into the sockets provided
for it. Said board then accomodates the SIMMs.

Do you have an ST(M) or an STFM?

AFAIK, the STFM power supply only has +5 & +12 volts output; the -12 comes
from a special inverter type Ic that generates the 12 volts for the serial
port.

Are the STFM & Falcon supplies the same size & are the pinouts the same?

1294. Re: MinixFS on large partitions...

Newsgroup: comp.sys.atari.st
Date: 1996-01-21 00:00:00 UTC
From: sanders@sci.kun.nl
Message-ID: <4dubit$i5h@studs.sci.kun.nl>
Source record: 152577

Hmmm. I got minit so far as to initialize the partition by manually specifying the number of blocks with the -b switch. It still gave a bus error afterwards, but at least I have a minix partition now.

But: although it is completely empty, both the Show Info dialog of the desktop as `df' report that it's approx. 35% full! So instead of 500M I only have about 330 left. Now what?

Oh yes, trying to open a window from the destop with this drive results in a FATAL MiNT error (something about rm_q), althoug I have mfsconfig'ed the drive w/ TOS protection and such. (It does work in plain TOS, although the 0 byte file I `touch'ed on the drive to test Some.long_filename.blabla didn't show up then).

What am I doing wrong? I did succesfully install a Minix partition on a floppy...

And before anyone notices: I _did_ say -V to minit to specify a v2 FS.

Argh.

Regards,

From: jws4p@fermi.clas.Virginia.EDU
Message-ID: <DLJo2L.I8@murdoch.acc.Virginia.EDU>
Source record: 152578

LPS.TTP (stands for long-play samples) will play WAV's, AU's, and most other common sound formats, on a standard Atari ST. The best thing about it is that it plays the samples directly off the hard disk (or ram disk, but floppies are too slow), so that the sample is not fully loaded into memory before playing and thus samples of indefinite length can be played. The sound quality is not stellar for an Atari, but still better, by far, than a PC-speaker driver, for example. It is a TOS ttp program which only has a command line interface, which is a slight drawback, but you can install it as an application and then play any sample from the desktop just by double clicking on it. LPS.TTP is available somewhere in the Merit/UMich Atari Archives, probably in the sound directory or maybe in utilities... not exactly sure where. Anyway, good luck.

From: helling@uwindsor.ca
Message-ID: <DLK2IC.C1L@news.uwindsor.ca>
Source record: 152580

I have an odd ICD scsi adapter for the Mega (I presume the mega2-manual don't say) that is supposed to fit INTERNALLY, connecting to an INTERNAL DMA plug, and allowing one, with an included bracket, to put a small scsi drive inside the MEGA...
Made by ICD, memtioned in their standard manual that came with the ADSCSI... Most likely a baby, clockless version of the adscsi...

I will swap it for any external HD adapter for the 1040stfm...
I am told I could make a kludge cable to run this with the 1040, but it's too much work...

The little board, the disk, the manual, the power cable, the drive mounting bracket... Don't ask me more, I DO NOT even know what an M2 or whatever looks like inside.

Will swap for:
Any icd external board & cable to hd port.
Any other Atari external HD setup, even one with a blown mfm or scsi drive in it, as long as the board electronics are apparently ok (safe bet: the drive don't turn any more)

We each handle our shipping...

Or make a huge (ha!) cash offer... really want the swap instead, hence the operative term- huge....

Cheers..

I would like one as well, I did try DeskPac (Acc), but it caused some
problems on MY system. Though it certainly had a nice array of features.

Although not a CPX, Edhak had a small acc called Diary which allowed you to
jot down notes and the like. Edhak is good for that as well, but a bit OTT
for what Hallvard (and me) need IMHO.And of course not a CPX!

BeST wishes

I think us Atari people are nice to each other nowadays because other people aren't nice to us. Therefore we have to stick together against the common threat to us all - Bill Crapsware and co - after all who needs Bill's gate and windows, when our very own are cheaper, more reliable and well up to the job!

But seriously (wasn't I?), this group is full of info and help, and friendly as well. The advice and help I have received from this area and the Demon Atari support area make it all worthwhile.

1302. MinixFS on large partitions...

Newsgroup: comp.sys.atari.st
Date: 1996-01-21 00:00:00 UTC
From: sanders@sci.kun.nl
Message-ID: <4du8n7$hd1@studs.sci.kun.nl>
Source record: 152585

Hi,

So, after succesfully installing a nice DEC RZ26L 1G SCSI drive in
my beloved Falcon, I decided to partition it in two equal partitions.
One for TOS and one for MinixFS.

But typing minit to it took a _long_ time - it turned out my computer
`hung'. I had to minit -r it, after which I tried minit -t to see
what was wrong. This is what it said:

```
% minit -t e:
Sector size 16384
Cluster size in sectors: 2
Cluster size in bytes: -32768 <---!!!
Root dir length 1
Fat size 2
Second Fat start 3
First data record 6
Flags 1
Total Clusters 16028
```

and after this, a Bus error occurred!

% minit -t c: (my internal IDE) worked fine.

What gives? How can I convice minit to work with my nice new drive?

Driver is AHDO 6.0x (sorry not sure about that last one. 5 or 6.)

Please help!

Regards,
--
```
/* sanders@sci.kun.nl */ main(){char*c="2$$,$$2CD$45$$,$$5(D$4%$$,$$%(D$4%J\

I don't like it all that much! But what I do like is the software, which is
really what makes or breaks a platform.

>: Let's just see who can still find new software for their machine in 5
>: years' time, shall we?
>Oh, be careful with what you say ;-) ! Just look at what happens in PC-
>and Mac-worlds: new computers and games become old-fashioned in less than
>2 years. And the problem is getting worse... I wouldn't be surprised, if
>_you_ had more trouble finding new software than we will, in 2001 =) !!

I look at it this way: a 486 is getting on a bit, but it can still run the
majority of new PC software. A Pentium should have an even longer shelf
life, as the P6 (now Pentium Pro) isn't going to replace it as Intel had
hoped. If enough people refuse to upgrade beyond Pentium in a few years'
time, the bulk of new software will continue to be released for that
processor. The home PC explosion has been based around fast 486es and
Pentiums, so this is a distinct possibility. The only thing that worries
me is that I may have to install Windows 95 sooner or later. I'd rather
not, but I want the latest Cinemania. <grumble>

The Atari scene may still survive through developments by enthusiasts, if
enough people hold on to their machines (although it looks like that has
started to happen already).

>: And to think that three years ago, I was heavily pro-Falcon and anti-PC.
>: Self-righteous Falcon-owning tits are becoming as irritating to me now as
>: Acorn Archimedes owners were back then (and still are).
>Do you know what you sound like, now? Bitter. Bitter for choosing the
>wrong alternative. I hope it isn't so.

!! No, I haven't. What I might be bitter about is having to throw
principles to the wind and buy a PC. Having kept my STE might still save me
from the Bad Fire, though. (: And to be honest, if I won a fortune
tomorrow, a Falcon Mk II and Cubase Audio would almost certainly be on my
shopping list.

>you have decided that you are right, and we are wrong. And when we don't
>immediately agree with you, you decide that we are fanatical lot who can

>never be "brought to Light"...

I may well have been generalising somewhat, but certain parties really do seem completely unwilling to consider the advantages of another platform. You can't argue opinion, but you can tackle glaring factual inaccuracies and irrelevant arguments. Day in, day out, the PC gets a roasting in this newsgroup. Sometimes justified, sometimes not. But would it happen at all if a lot of Atari owners didn't see it as a threat?

STfm's and STe's have an RCA-type plug on the rear panel, which connect to a small box which switches between tv and computer; this is the same box as used by nintendo, etc. games which use the tv as monitor. This is what I use to output animations and titles to video. The computer interferes with the tv receiver, though, and the picture is fuzzy. A genlock is an external hardware item which reconciles the timing errors, and supposedly sends a better quality signal.

> Isn't there a hardwrae hack to do this on other ST's?

The ST's printer port is bi-directional too. This isn't the problem
however. Its the lack of control signals. For instance the DE-600 pocket
lan adapator only requires a single direction port. However it needs a full
set of control signals so that it can feed data back to the machine. No
Atari AFAIK has all these signals connected.

If you are really desperate to use a printer port device - I can only
sugest you get hold of the diagram for the DE600 catridge port interface
- and write your own driver software for the device in question.

>>
>So I take it that means I can't use my Falcon power supply in my ST?

Yes. I think you can't use the seriell Interface without -12 Volt.
(This Mainboard (newer one??) have a -12 Volt Generator
on Board, sorry i'm not sure)

Use a save Way!
Use a *Voltchecker* and look at the plugs of both
PowerSupplys *before* your start this work!

Look at Falcon's PCON8 (J14 on PCB) (PowerIN)

```
red | o A1 ----------+
red | o B2 ----------+--------- + 5VDC to Logic
red | o C3 ----------+
black | o D4 -----+
black | o E5 -----+
black | o F6 -----+
black | o G7 -----+
blue | o H8 -----|-------------- +12VDC use by FAN ect.
|
_|_
Mainboard GND
```

Use a Voltchecker to check out your ST-PowerSupply first!
(Look at the color of the wires..) Don't chance any Wire..
Your Board blows up! Beware of ShortCircuit..

Any luck - you'll get dozens of useful posts on this. If not - hope some of this helps ;-)

> Umm.... The TT030 I got has this enviroment called TOS and GEM...
> How do I use it? Can I get something better? Also, should I have

TOS is the underlying OS and is in structure very much like MS-DOS. GEM is the graphical front end - and what you can see when you boot the machine is basically GEM Desktop. Works not unlike Apple Finder, MS Windows or X - but inherently doesn't do much. There are no built in applications. However hopefully there is something of use on the HD - and there is plenty on the 'net which will be of use to you.

> Where on earth is the shell?

There is no shell builtin! ;-) However there are many available - one of which should suit your taste.

If you are used to Unix - two obvious choices spring to mind:

1) MiNT. This is a BSD like multitasking extension to TOS. In its comercial form (MultiTOS) it gives a multitasking GEM desktop as well. However the kernel is freeware and its quite possible to build a Unix like OS which also has the ability to run Atari native code. There is a free port of X11R5 to MiNT - and a TCP/IP stack.

2) Linux/68. Probably much more to your liking. Completly abandons the TOS/GEM and repaces it with the 680X0 CPU port of the Linux OS. Also free - and much more Unix like. This has a port of X11R6 (among loads of other stuff) and naturally a TCP/IP stack. Also does virtual memory - which MiNT doesn't.

> the option of choosing TT high resolution? If so... it is not giving
> me that. Does this mean it is broken? Needless to say, I am lost...

TT-Hi is only available if you have the special Atari TT-Hi monitor. The other modes are available on the standard colour one. To get all modes - you need 2 monitors. TT-Hi is an ECL output - so regardless of how good your colour monitor is - it won't display on it.

> Anotherthing... My system has a
> modem1,modem2,serial1,serial2 port... that is 4 serials I counted.
> What gives?

Nothing gives. You have 4 serial ports. Two are slow (<=19200). One will certainly do 115200 - and the other one at least 38400. Also if you use the LAN port (very unlikely) - then one of the serial ports is disabled. I forget which is which though.

> AlsoWhat is this "Warp9" accelerator.. like what CPU
> and speed?

Warp9 is a software accelerator which replaces parts of the GEM environment with more efficient code. A more popular product to do this is NVDI.

As standard the TT is a 68030@32Mhz with a 68882 FPU also @32Mhz.

> Sorry for dumb questions... but this is first time I even turned on
> an Atari system and being used to NeXT, SVR4, and other UNIXes...
> this is really confusing here...:-(

Well Ataris are not like Unix machines really - but can be made so if you want. I run MiNT, Linux/68 and TOS/GEM on mine - so I get the best of all worlds.

TTs were designed to run Unix though as an option - and although that port is not available anymore - with Linux/68 it doesn't really matter.

:-)

Roland.

Message-ID: <4dsceo$avt@sundog.tiac.net>
Source record: 152596

I got Xformer 3.31 from your web page, thanks.

My userid, password is not good for Gemulator 95, though.

BTW this is eretic@tiac.net (darkforc is my slip account, my
IP seperates it's slip from shell accounts, being two different
mailboxes, etc).

Did Toad also tell you about my Gemulator registration, or
just Xformer?

Anyway, I'd like more info on what the drive cable is all
about. I bought St Xformer 3.0 a long time ago, with
the ST Xformer cable. Is the PC Xformer cable, much along the
same idea? Same electronics, or different?

> Linux has ext2, so there's hardly a need for minix v2.

yes there is if you run a MiNTNET system as well as a Linux system , or indeed
any other system that runs on a minixfs. Since if like me you want to network
them and mount the mint drives on the linux system .. pity you can't do the other
way round but never mind.

you will also find that it having a minixfs already setup makes building a system
easier for linux since it makes installing fs etc when you only have a ramsdisk
although obviously you wouldn't want to make one just for that use.

Source record: 152599

Thomas Cloer (Thomas_Cloer@s4.maus.de) wrote:
: MultiTeX is not quite bad, but the TeX version is still 3.141, Lindners is
: 3.1415. I strongly recommend Lindner's version, and the TeXShell v3.76 can even
: be used under MultiTOS and MagiC. All You need is an alternative Desktop like
: GEMINI or THING. You should configure TEXSHELL.PRG as a .TOS-program or rename
: it to TEXSHELL.TOS. This will force all Output to be shown in the
: MINIWIN/VT52-Window instead of writing directly to the screen.

A couple of followup questions: Will TeXShell multitask properly under
Geneva? I haven't tried the trick you mention, but it may work. Also,
will Linder's TeX support Latex2e (I know it should, but you never know).
And is there a big version? I need a bigtex in order to do relatively
complex documents (i.e. graphs with eepic). I'm happy with CS-TeX, but it
seems a bit slow, even on my TT, and I think I read somewhere that
Linder's was faster.

Thanks...

It's 500M, so it's just a bit less. I read the warning. But I didn't
think it applied to my situation. But I don't completely remember it,
though.

>He reccommends using Hushi or HDDriver.

Both commercial?

>How about trying two partitions of 256 Mbytes.

Hmmm. Repartitioning will destroy my TOS partition as well, I'm
afraid...

>My minix partition is <128 Mbytes in size & I use AHDI. Works ok.

Well, minit -t didn't bomb out on me on my internal HD (which is
65M).

>Have you run fsck on it ?

Couldn't. (No minix partition!)
But I guess, since I did manage to make a minix partition now, I could
give fsck another try.

: >Stephen Mulrine (robotron@moroder.demon.co.uk) wrote:
: >: [..]

: I don't like it all that much! But what I do like is the software, which is
: really what makes or breaks a platform.

Yes, there are some very nice PC-programs available. But then again, there are many that, I think, are pretty much over-advertised =(. For Atari, Calamus, Cubase, and perhaps Notator have been such system-sellers. For Falcon, Apex Media, Cubase Audio 16 and some others are that. It's a pity so many PC-programs have to be as huge (and therefore slow) as they are. In today's computer market, size seems to be a selling argument over quality...

: I look at it this way: a 486 is getting on a bit, but it can still run the
: majority of new PC software. A Pentium should have an even longer shelf
: life, as the P6 (now Pentium Pro) isn't going to replace it as Intel had
: hoped. If enough people refuse to upgrade beyond Pentium in a few years'
: time, the bulk of new software will continue to be released for that
: processor. The home PC explosion has been based around fast 486es and
: Pentiums, so this is a distinct possibility. The only thing that worries
: me is that I may have to install Windows 95 sooner or later. I'd rather
: not, but I want the latest Cinemania. <grumble>

You'll probably have to install 95. Even I probably will ;-)... Some day. I'd like think you're right - that Pentium will have more years ahead of if than 386 and 486 did. But somehow I very much doubt it. This is why: it wouldn't please people who make and sell computers and software. Now, when almost everybody uses pretty similar computers, and there's little choice for us available, we more or less have to do what industry wants us to do. New games will be Pentium and Win 95 _only_, no matter what we think of it! It's easy to see as early as now..

There already are games available that don't work in _any_ current PC very well. I wonder what the next game generation will be like, if this continues? With Win 95 and its windowing, new games will probably be even slower than today's game-monsters. And games sell computers, very much. If enough people will want P6 machines to play their virtual reality games, then industry will abandon both 486 and Pentium without a second thought. This has happened, and this will happen again.

The whole circus can work as long a people like us upgrade our computers and software all the time. The times of someone using his Amiga/ST for 10 years, and still getting new programs for them, are almost over...

I don't object/dislike PC as itself that much - I dislike the new, cold
business culture it has created... A world where _we_ who should decide
what we want, no longer have real influence over anything.

: !! No, I haven't. What I might be bitter about is having to throw
: principles to the wind and buy a PC. Having kept my STE might still save me
: from the Bad Fire, though. (: And to be honest, if I won a fortune
: tomorrow, a Falcon Mk II and Cubase Audio would almost certainly be on my
: shopping list.

Well, Cubase Audio is a very special program... I just wish they'd have
used a bit more color in it =)! Even its PC-versions look a little dull,
I think. Maybe people at Steinberg are color blind 8-) !

: >you have decided that you are right, and we are wrong. And when we don't
: >immediately agree with you, you decide that we are fanatical lot who can
: >never be "brought to Light"...
:
: I may well have been generalising somewhat, but certain parties really do
: seem completely unwilling to consider the advantages of another platform.

Yes, that's true... It's always wise to try to keep ones eyes open.

: You can't argue opinion, but you can tackle glaring factual inaccuracies and
: irrelevant arguments. Day in, day out, the PC gets a roasting in this
: newsgroup. Sometimes justified, sometimes not. But would it happen at all
: if a lot of Atari owners didn't see it as a threat?

Well, after the years of Atari-jokes most of us have probably got from
"the others", it's small wonder many people react rather heatedly to everything
thay sounds like: "why don't you go and buy yourself a REAL computer - are you
a little stupid, or what..?" ;-) We've all had our share of that - and it
gets a little boring in the end. Irritating, some might say..

I guess, it's never easy to belong to any minority.

Greetings,
Tommi

: : produce..?
: : Quite nice, actually: compressing sound into 1:5..1:10 with little loss
: : of quality! Are makers of 525 and such programs reading this? Can and
: : will this be done, or is it too hard a task for Falcon?
:
: I have been thinking about this one. I don't think it would be a hard
: task for Falcon to play MPEG with sound, but the non-standard audio
: sample rates on Falcon would mean an extra CPU overhead as the player
: would need to take the 44, 22 or 11kHz audio and interpolate that to one
: of the Falcon frequencies (50, 33, 25, 12.5kHz etc...). I am not a
: hardware expert so does anyone know what sort of CPU overhead this task
: would impose upon MPEG playback???

Yes, it should be possible to make... I began to wonder this after a friend
of mine began recording CD-music with a PC using an expensive DSP sound card
(sorry, don't remember which one..). He makes .WAW -files that may be MPEG-
compressed from about 1:2 to over 1:10. Even levels like 1:6 sound very
good! He asked whether I can read and use those files in my Falcon...
Then I saw a program in Macintosh, capable of doing the same.

Who could make one for us, too..?

Cheers,
Tommi

1326. Does a TT have NVRAM?

Newsgroup: comp.sys.atari.st

100422.651@compuserve.com (Michel Vanhamme) said:-

>So, my question is: does a TT have NVRAM, and if so, what can be
>configured in it?

Yes the TT has nvram, AFAIK 48 usable bytes (just like the Falc), but only one byte is used: which one exactly I dont remember, but have somewhere the info, so if it's important just email me. In bootconf it's the flag which permits to boot TOS or Unix SVR4 (on a Falcon it just stops the booting process).

I suddenly remember it's the second byte of the accessible part of the nvram... this one addressed as 1 in the xbios NVM_access command. If 0 then boot TOS, if !0 boot Unix (_IF_ there is an SVR4 on your TT).

Total NVRam is 64 bytes, the 14 first are for the clock, then 48 bytes accessible by NVM_access (remaped as 0 to 47, really 14 to 61), and the last 2 are a sort of checksum of the 48 before... yes, it's if this checksum is bad that Falcons boot in english, with qwerty keyb and so on. need a reset: NVM_access(2) or XBIOS(46,2)

Hope it helps like you helped me for B+ downloading... bye!

Just to avoid confusion, Oasis is the offline part - this is a NOS
problem ...

I'm not entirely sure but I think so. NOS does support slip and some
people have said that NOS can be made to dynamically obtain the
address by either omitting it in STARTUP.NOS or by setting it to zero
(probably boils down to the same thing).

I have not tried SLIP but one time I tried to get the address
dynamically with PPP by omitting my ip address. It did work. This was
with NOS 0.42

>
>Could it be some problem with this setup ??

As far as I understand, the CPX modules/Xcontrol control panel were
designed with TOS 2.xx and upwards. You might be able to run them
without problems if you install TOS 2.06 in your machine.

By the way, i downloaded both the 550C and 660C drivers yesterday, and
found out that only the 660C makes a CPX module- is there any way to
get a CPX module for the 550C? Yes, I tried fiddling arround with the
".sys" file...

Not necessarily, but XaAES sounds much better than XAES :)

There was a library for making GEM programs look crap. Well, it wasn't
meant to do that, but that was it's main effect. The guys thought it was
a good idea to do all the window borders etc themselves in an application.

They were talking about it in gemlist about a year and a half ago.

> all know it!

Atari hasn't produced a *really* good machine since the original ST. They certainly haven't made any attempt to sell anything after the ST IMHO.

I certainly won't cheer if Atari were to shrivel up and die - but they deserve little better. They haven't done anything for thier loyal customers for quite some time - and really we've all been abandoned by them.

As far as I care - Atari can do whatever they want. If they can stay in business then fine. Anyhow - their future impact one way or another on the video gaming industry is likely to be small. They don't have the money to compete with the likes of Sega, Nintendo and Sony.

:-(

Well, I tried some irc last night. I could not get STiK and the irc client to work. It just sat there after I joined #atari, sometimes doing nothing but mostly with the modem SD light blazing away. Then I got rid of MagiC and tried it under plain TOS 1.4 - still no joy.

So I telnetted in to irc.demon.co.uk with NOS. After trying it with and without the vt100 emulator, garbage was still all over the screen. Finally I went for the terminal "none" option, which was fine except for no screen formatting. It was unusable.

Is there an irc server that supports VT52 or is there some sort of VTxxx emulator that does work?

It was my first time and it didn't help with everything trundling off the screen.

Apologies to everyone who had to put up with me ;-)

Sounds like NOS's vt100 emulation doesn't work.

>Is there an irc server that supports VT52 or is there some sort of

You mean a telnet server? I can give you an account on my linux box which
you can use, I haven't got it to support vt52 yet but I should be able to
soon.

>It was my first time and it didn't help with everything trundling off

Medium Res !!! That is gonna be a bit difficult to work with video is it not since the aspect is all wrong ...

Any animation prog that supports med rez will do it but the results are going to be a bit disappointing IMHO.

However for the task I wholeheratedly recommend the Cyber series , Paint/ Sculpt & Studio as the best way to do wat you want. they work in med rez BTW but render in STLOW but as considering they are very old software extremely powerful and most underrated ST software IMHO.

There is a warning in one of the DOC files about using Minit on "HUGE" partitions. By "HUGE" , I assume that the author means > 512 Mbyte.
Is yours like this?

He mentions problems with Disk driver software , maybe AHDI is affected.
He said he has tried to workaround these bugs, but ...

He reccommends using Hushi or HDDriver.

How about trying two partitions of 256 Mbytes.

My minix partition is <128 Mbytes in size & I use AHDI. Works ok.

Have you run fsck on it ?

>Doom clone was possible.

It certainly does, and it certainly is :-)

The DSP _really_ helps with graphics - check out Apex Media from
Titan Designs/BSS.

There is a Doom clone in progress for the Falcon... its called
Bad Mood, and is using the DSP to great effect :-)

Check out http://rand.thn.htu.se/~johan/bad_mood.html for more
info...

>I don't think I can go past two, unless there's some fancy

They do exist... eg. SBM (actually allows 6 - two on keyboard as well)

>
> WHAT'S THE DEAL? The Falcon doesn't really interlace! It just fakes it!

What?!!
I would say it's interlaced in the true sence of the word!
A TV-picture are buildt up the same way! A tv displays a whole picture at a rate of 30fps, but it displays 2 half-pictures at a rate of 60fps. I believe that's excactly what the Falcon does, isn't it?
Anyway I don't see any problem, why use the TV at all?

I do not think, that it is an useful information for you, but...
yes, there is a way to fit an IDE into a ST. There is a repair shop in
Warsaw, where they mount IDE drives into STs. Many people in Poland
have such drives in their machines.

I> He finally thought that Falcon _is_ the better computer, but PC has
I> the better
I> games. The result: he decides to keep and use both =) !

May I add a couple of thoughts? I agree with Tommi. I have an Atari Falcon which I love dearly but I have to use PC's at work. I also have a Pentium laptop. Windows 95 really sucks! I have a Pentium 90 mega fast cpu and the operation system crawls along because I have 'only' 8Mb ram. It's accessing the disk drive all the time! It's pretty and does a couple of nice things that the Atari O/S's don't do yet like the printer driver needs only to be recognised by the O/S and also the clipboard is recognised by all applications. But I am frustrated by the 640k memory limitation for DOS programs and that the system runs slower than the Falcon becuase of the crap O/S.
The point about buying something different also holds true. Competiton is good. At the moment I see the whole computer world going Microsoft. It's a slow creeping insidious disease. I work on mainframes and I see MS making agreements with the mainframe manufacturers as well. What does the future hold for us? Mainframes and PC's only able to run MS software? Do we really want the future of the computer industry to be completely dominated by one man/company? Do we really want choice to be a thing of the past? Do we really want one man controlling the most powerful method of accessing information? Do we want every computer in the world to be based on the 8086 and a 640k memory limitation? I would suggest to anyone who likes the idea of choice and freedom NOT to buy Microsoft products. Especially if you work in the IT industry.
Food for thought?
Bye bye!
Dean

1363. HELP! Need Dr. T K-5 Editor Librarian For Atari ST

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: ad329@freenet.hamilton.on.ca
Message-ID: <4dvfcg$p9q@main.freenet.hamilton.on.ca>
Source record: 152385
Cross-posted to: comp.sys.atari.st,rec.music.makers.synth

Well, what happened the other day? I wasn't paying attention and I accidently wrote the internal memory of my K5m onto the cart. Oh well, no big deal, I'll just whip out my handy Dr. T K5 Editor Librarian and reload that card.

Ahhh!!!! The disk is corrupt!!!! No problem, stay calm, use the backup. Ahhh!!!! The backup is corrupt. Well, I guess that should be expected. It's been six years since I last backed it up.

I'll just check the area Music stores, some of them have old discontinued ST software in bargain bins.

Ahhhh!!! No Dr. T K5 editor librarian (infact very little useful ST software to be found).

What to do, what to do? I know, let's pray to the gods of the internet!

Please please please hear my desperate plea. If anyone out there is using Dr. T's K5 editor for the Atari ST, knows a place where I can download it, or knows some way I can get a hold of a copy of it please have mercy on my soul and contact me in E-mail.

At this point it doesn't even have to be the actual Dr T. editor/Librarian. Even a simple Shareware/PD librarian that is file compatable with Dr. T's K5 Editor Librarian will do the trick for now.

Yes, but I don't think anything uses it; at any rate Atari haven't documented
it. The reason it's in there is that it comes built into the clock chip.

You don't have enough free memory to hold the entire page. SpeedoGDOS 4.x has a bug here: It starts printing nevertheless, resulting in an all-black ink lake.

bye, Peter

1367. Database/SS with Pictures and Inter-record calculation

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4dvjgc$3j7@status.gen.nz>
Source record: 152389

I am looking for a Database or Spreadsheet which allows pictures and text to be associated with each record.

It also needs to be able to fill out a field in one record with calculations performed on fields from multiple other records. For example, I might have 10 records, each having a single figure in it. I want to total the figures out of all those records and put the total into a field of a new record.

I have been unable to find any Database or Spreadsheet which can do this. Superbase seem the closest, but I do not have time to write a superbase application to do the calculating.

If anybody has any ideas, please let me know.

TIA for any suggestions.

That's a known problem, and arises only with TOS, not MagiC.

I had the same phenomena with my FX-Card and FastRAM, when running TOS.
But there exists a patch program that disables the BLiTTER, so that the
problem doesn't arise with TOS and FastRAM.

Hi Tommi,

I> Btw, it's weird, this 660C. I just managed to tune-up my Calamus SL
I> to print somewhat correctly with 660C - and the results are FANTASTIC!

I> Yes - Calamus & 660C produce far better results than ANY demo doc I've
I> seen from HP this far. Even skin-tones are natural! The fabulous 850C
I> DeskJet hardly matches this =) ! Atari software seems to be superior
I> to many, if not most, PC-applications in what comes to print quality!
I have a Falcon & Calamus SL with a HP550C printer (300*300 dpi in color). I
wish to print much better quality pictures. I was thinking of buying an Epson
stylus 720dpi printer especially since the newer HP printers have to work with
Windows to get best results. What paper & version of Calamus SL have you got?
How did you get it to work so well with the HP660C? Any idea of the difference
between the HP and the Epson?

Thanks in advance!
Bye bye!
Dean

I have Gemulator 4.0 (Might be considered pre Gemulator 95)

Darek did a unique approach to hadling the problem of accessing
larger than > 32 meg partitions by patching part of the TOS area that
presents this bug, so now not only can you access as large a partition
as you want (I don't know what the new maximum is, probably 2 gigs).
I can access my CD ROM and ZIP disc, a 350 meg C: drive, a 300 meg D:
drive, and 500 meg E: drive.

Also sound I haven't had luck with, but since I'm using Gemulator 4.0,
and not any of the updates. I'm trying to get onto Darek's Web page

to get the new Gemulator 4.11, It's funny how I got access for the private downloads of PC Xformer 3.3, but now Gemulator 95 free updates. There is no rush, as I have a lot going on here.

He said there are many big fixes, but still no MIDI, or joystick.

Once Sound and Joystick is going, I can pull out my collection of games. I never really went into the MIDI area, but it would be nice to use programs in the future, should I decide to get that cool Yamaha synth I always wanted.

Eric

1374. CAB Likes To Crash

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: Cooter <mmcgow1@zeus.towson.edu>
Message-ID: <Pine.ULT.3.91.960122034910.19077A-100000@zeus.towson.edu>
Source record: 152396

CAB is weird. When I run it for the first time after a boot, I get some kind of error (probably in German) that stretches across the top of my screen and right off of the screen on a single line. No idea what that's all about since I don't understand what it reads. It starts out with the number "1." When I press the number "2" key, it then preceeds to load the home page that came with the archive.

Now, if I should go back to the desktop then reload CAB, I don't get that error across the screen anymore. It just brings up the home page automatically. This happens everytime. The first execution of CAB gives me the bug, but every execution afterwards (w/o a reboot) seems to work just fine.

Next error...whenever I try to open a URL, it seems like it begins, then I get another error: "runtime error 163 at offset $FFF1AC12." And tonight, I even got a new one when I attempted to open a URL (new might be good :)): "runtime error 202 at offset $FFF33282."

I think I started with Stik back in Sept. Took a few weeks off from fooling with it, next time I came back, I got Stik working. Now I've been fooling with Cab for the past 2 months and I've tried everything I can think of. I even changed modems and baud rates and got different results, but didn't get much farther along.

Yes, I have HSMOD6.

Can anybody help before I delete Stik and CAB? I wish I never bought this Falcon...it's time I get a PC.

Guy Harrison (guy@swampdog.demon.co.uk) wrote:
> Is there anybody who can summerise the differences between Lattice C
> version 5, and Lattice C version 5.60?

I have owned v5.06.02 since mid-91, and upgrqaded to v5.60 in mid-94.
(Both were purchased direct from Hisoft)

(I no longer have my 5.06.02 master discs, but do have backup copies of
them somewhere. [Note to Hisoft re:Copyright :- NO, I DID NOT OFFER TO
COPY SAID SOFTWARE FOR PERSON!]

> Bug fixes, library code / extensions, that sort of thing. Basically,
> is V5 worth buying (at how much discount) over V5.6?

For me, v5 would get the big thumbs down unless it was about $5-10 (approx
11-22 GBP at todays exchange rate of NZ$1=GBP0.44). In my case v5 is a
sadly inferior product when compared to v5.60. But YMMV however

My personal experiences with 5.06.02 and 5.60:

v5.60 has:
1) a much faster assembler (2.5 to 3x faster)

2) a more integrated environment (More menus, dialogs, configurability)

3) allows more open source-file windows (v5 allows 4, v5.60 allows 6+1)

4) output messages from compiler &c go in a window so you can peruse them
while fixing the inevitable typos, errors.

5) Falcon/MulitTOS header/libraries (which might work with v5)

6) Maths co-processor libraries (Optional, extra-cost in v5)

7) Re-printed manuals. (Alas, not the spiral bound ones from v5)

8) Up to 20 installed tools (v5 only allowed about 10, I recall)

9) v5.60 produces better machine code than v5. (Smaller, faster)

10) "Modern Atari System Software" book is bundled "free" (Reference to
MultiTOS, Falcon TOS, MiNT)

11) A "3D" resource creator is bundled. (V5 doesn't allow creation of
"3d" dialogs, buttons...)

12) Resource files can now be embedded into programs.

On the downside, v5.60 is
1) More disc intensive storage-wise

2) Environment is prone to crash in some cases under MTOS (If "Messages" window is window "3", and you open windows "4", "5" and "6", do some editing in those windows, then drop to the desktop and run another program, Lattice is likely to crash when you switch back to it, or try to compile again. It will also spit-the-dummy if the "messages" window is beyond window #4.

3) Perfect bound manuals wont lie flat, like v5 spiral-bound manuals.

4) v5 .LNK files are ignored. v5.60 uses .PRJ project files.

5) Prevents multiTasking whilst compiling/linking.

6) No way to create colour icons.

7) Compiler still wont allow some legal '030 code (longword register offsets, for example) and internal compiler errors are just as prevalent as v5.

8) Libraries are more robust - and slightly faster.

> Will either compile NOS 0.42?

Dunno. Never seen the source to NOS, so can't comment on that particular case.

If you have "clean" ANSI code, it should compile, as most "clean" ANSI code I have seen will compile "straight out of the box".

It's possible that the IRC server you're using is:

1) Not connected to Effnet/CERFNet/DALnet (i.e. Undernet)
2) Frequently on a netsplit alone

Solution: Use a different IRC server. There's almost always someone
there, even if it's just Radak and his bot.

1380. Does a TT have NVRAM?

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: 100422.651@compuserve.com
Message-ID: <4e0hni$3q1@dub-news-svc-1.compuserve.com>
Source record: 152402

Hi all,

I was playing around the other day with Bootconf on my Falcon (the peogram that lets you choose language, keyboard mapping etc. and saves this to NVRAM) when I noticed that the program stated that it was for Falcons _and_ TTs. I immediately carried it over to my TT, and after a few minutes of tweaking, I still hadn't managed to change anything to it.

So, my question is: does a TT have NVRAM, and if so, what can be configured in it?

TIA,

Michel

/* Michel Vanhamme 100422.651@compuserve.com */

1381. Time for a new version of STZip? (like Lharc 3.10?)

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <3103c4121118b4a2@sn.no>
Source record: 152403

I'd really like to se an updated version of STZip, or a brand new
ZIP type program for the ST.

Here's the situation: I use STZip (2.6) all the time because ZIP
seems to be the most compatible compression system cross-platform wise.
I work in a Unix environment when I'm online and using .Zoo or .Lzh or
whatever just won't do.
Now, STZip compressed files work fine with Unix and vice versa. It's
supposed to work with PCs as well, but I never use PCs, I wonder why ;-)

What bugs me is the cumbersome and slow way STZip works. I'd much
rather have it work like Lharc 3.10 which is *excellent* as far as I'm
concerned. It's effective, fast and looks great as well!
The only problem is.... that it doesn't do ZIP!
So, how about a new ZIP program based on Lharc 3.10? If the programmer
of Lharc 3.10 reads this- how about making a Zip program as well?

1382. Dialup Web Pages

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: "David C. Troy" <dave@toad.net>
Message-ID: <3103F254.75D4@toad.net>
Source record: 152476

TOAD COMPUTERS ANNOUNCES FREE DIALUP WEB PAGES

As of today, we have opened up free, worldwide, dialup access to our web pages. How does it work? You call (410) 544-6999 and login as 'guest'. You then get access to "lynx" -- the text based web browser. From there, you can do everything that you normally would from our web pages over the Internet. You can also access our ftp site, download files, and order products with our HTML order forms.

WHAT DO YOU NEED TO BROWSE THE DIALUP WEB PAGES?

Lynx relies on having a VT-100 compliant terminal screen, such as you would have with STalker or Flash II on an Atari. If you're using a PC compatible or Mac, just be sure you're using a VT-100 compliant terminal program.

WHAT DO YOU NEED TO DOWNLOAD FILES?

Lynx executes the unix command "sz" (send Zmodem) to transfer files to your computer. This means that you'll need to have Zmodem download capability. STalker and Flash II both do, and pretty much every other terminal program does too.

WHY USE THE DIALUP WEB PAGES?

The dialup web pages are intended for use by people who do not have Internet access. The pages work better, look better, and are going to be much more useful to you if you can access them over the Internet using a browser like Netscape or CAB (ST browser). However, the dialup facility is also useful because it makes product demos, as well as Web browsing software (like WWW116.ZIP) available for download -- without requiring that you already have Internet access (a classic catch 22!)

WHY WE'RE REALLY EXCITED ABOUT THIS

We used to run a BBS here that folks could dial into, but it was just one more thing to maintain. We were always worrying whether it was up to date with our web pages, etc. By merging the BBS and the web pages into one functional entity, we are better able to maintain the information/software we supply.

TO SUMMARIZE:

Toad Dialup Web Pages (410) 544-6999
Login as "guest"
No password is required

Thanks! We hope you enjoy the service!

Dave

JE> Is there a backupsoft for SCSI Streamer ?

Hello Jan,
If I were you, I'd buy Diamond Back from HiSoft, which is said to support
almost any SCSI-tape drives available. The program is very good and I have
never had any problems with it (I don't have a SCSI-streamer though).
Now I run my backups on a consumer DAT thru my S/Pdif interface (which probably
is much slower than a streamer, but very cheap) or to my CD-writer instead...
;) (which is a little more expensive).

Best regards,

Claes

>stuff about NVDI though.

I am using NVDI myself, after years of using Warp9. Frankly, I think
the reports of Warp9's incompatibilities are WAY OVERBLOWN. I say this
from experience, I just did _NOT_ find a lot of incompatibility problems.
I chose to go with NVDI simply because it includes a better GDOS than
SpeedoGDOS and I don't regret it for a moment. As screen acceleration
goes, it's simply faster than Warp9.

I just wish I could find a '030-ready version of PinHead! PageStream takes
FOREVER to load on a 14Meg Falcon!

Atari software for sale:
All of the following software is on the original disks complete with
manuals in the original boxes (except Phoenix which didn't come in a box.)

Atari ST/STe/TT/Falcon Software Bundle 1:
$65 each or $185 for the bundle.

- TrueImage 24-bit image processing
- DA's Vektor
- CAD 3D2 with Cyber Sculpt and Phoenix 1 Object Renderer

Software Bundle 2:
$19 each or $69 for the bundle.

- Cyber Paint
- Spectrum 512
- Deluxe Paint
- Script (word processor)

Software Bundle 3:
$9 each or $40 for the bundle.

- Video Titling Disk (for use with Cyber Paint)
- DEGAS Elite
- DEGAS
- Aegis Animator
- Make It Move

USA and Canadian only, money order please, no personal checks.

Thanks.

Have you tried setting the flags on PGS so that it does not clear memory prior to loading? AFAIR pinhead turned this off for all programs except where stated in a config file.

Try setfast.prg (s/be on many boards else email me for a copy).

Background transfers with hard disks are not supported with most hard disk
drivers. You need a driver that is MagiC aware to do this trick. Try the
demo version of HDDRIVER on ftp://acp5.chemie.uni-kl.de/pub/atari/.

They are needed. When I installed Outside, the virtual memory driver, on my MultiTOS setup I found it very useful to change some programs' flags in order to stop them filling up my standard memory so much that there was no swap room left. It is extremely easy to do with the program supplied in the Outside distribution.

1393. HELP! Need Dr. T K-5 Editor Librarian For Atari ST

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: ad329@freenet.hamilton.on.ca
Message-ID: <4dvf6l$p9q@main.freenet.hamilton.on.ca>
Source record: 152487
Cross-posted to: comp.sys.atari.st,rec.music.maker.synth

Well, what happened the other day? I wasn't paying attention and I accidently wrote the internal memory of my K5m onto the cart. Oh well, no big deal, I'll just whip out my handy Dr. T K5 Editor Librarian and reload that card.

Ahhh!!!! The disk is corrupt!!!! No problem, stay calm, use the backup. Ahhh!!!! The backup is corrupt. Well, I guess that should be expected. It's been six years since I last backed it up.

I'll just check the area Music stores, some of them have old discontinued ST software in bargain bins.

Ahhhh!!! No Dr. T K5 editor librarian (infact very little useful ST software to be found).

What to do, what to do? I know, let's pray to the gods of the internet!

Please please please hear my desperate plea. If anyone out there is using Dr. T's K5 editor for the Atari ST, knows a place where I can download it, or knows some way I can get a hold of a copy of it please have mercy on my soul and contact me in E-mail.

At this point it doesn't even have to be the actual Dr T. editor/Librarian. Even a simple Shareware/PD librarian that is file compatable with Dr. T's K5 Editor Librarian will do the trick for now.

Tommi Hietavuo TKKK (thietavu@news.abo.fi) wrote:
: I just wonder, whether Falcon's DSP would be capable of creating and
: playing such MPEG-packed .WAW-files some PC- and Mac-applications
: produce..?
: Quite nice, actually: compressing sound into 1:5..1:10 with little loss
: of quality! Are makers of 525 and such programs reading this? Can and
: will this be done, or is it too hard a task for Falcon?

I have been thinking about this one. I don't think it would be a hard task for Falcon to play MPEG with sound, but the non-standard audio sample rates on Falcon would mean an extra CPU overhead as the player would need to take the 44, 22 or 11kHz audio and interpolate that to one of the Falcon frequencies (50, 33, 25, 12.5kHz etc...). I am not a hardware expert so does anyone know what sort of CPU overhead this task would impose upon MPEG playback???

Ciao, Chris Wilkinson

Why not? zoo originated on unix and I would be surprised to find a unix
system without it. lha is also available for unix

mnb20:~>lha
LHarc for UNIX V 1.02 Copyright(C) 1989 Y.Tagawa
LHx for MSDOS V C2.01 Copyright(C) 1990 H.Yoshizaki
LHx(arc) for OSK V 2.01 Modified 1990 Momozou
LHa for UNIX V 1.00 Copyright(C) 1992 Masaru Oki
usage: lha [-]{axelvudmcp}[qvnfodizg012][w=<dir>] archive_file [file...]
[etc]

>What bugs me is the cumbersome and slow way STZip works. I'd much
>rather have it work like Lharc 3.10 which is *excellent* as far as I'm
>concerned. It's effective, fast and looks great as well!

I agree with you about that though. Although I do think you're spoilt by
lharc 3.1, until I saw it I though ST-Zip was great, much nicer than the
command lines PC owners have to put up with. (the speed is largely a
function of the packing algorithm used although I'm sure it could be
improved)

No - you can program MTOS, with Lattice 5.52 (I did DUftp with 5.52). In
fact, the MiNT-net libs are only available compiled for 5.52...

Craig.

1408. [FS] Crazy Dots II VME card

Newsgroup: comp.sys.atari.st
Date: 1996-01-22 00:00:00 UTC
From: damms002@acpub.duke.edu
Message-ID: <4duopt$l0h@news.duke.edu>
Source record: 152502

I have a Crazy Dots II graphic card for all Ataris with VME port for sale.

I used the card in my TT but I don't need it any more.

Here are the specs:

ET4000 card for VME bus, resolutions up to 1664*1200 with 16 colors
1280*800 with 256 colors
and 800*608 with 32K

The card has 1 MB video memory and comes complete in original package,
driver software and manual in German, however, I would suggest to use
the card wglish manual, if necessary).

Asking price is 250$.

From: hallvart@sn.no
Message-ID: <3102b87c408c287@sn.no>
Source record: 152503

I'm working on my web pages right now as well as a local FTP site
where I'm busy setting up an Atari "must have" and useful range of
Auto programs, ACCessories and various utilities- especially for
people who have just started or don't know what's out there.

All the files can be downloaded via my web pages (partly out of order
for the moment) with instructions about all the files, or directly via
FTP.

Now, the problem is that I have several files which I've received
partly without documentation etc. I'd want to re-distribute them with
all files intact ofcourse...
I've been spending quite a few hours online (which I have to pay for
since I'm connected to a commercial provider and not through school)
and still haven't found the files I need.

So, could someone here please help me, either by telling me where the
files are, or send me the packages via email etc?

**** but *please* don't send them to me before you've contacted me- I
don't want to get 20 of the same files in my mailbox ! *****

The files I'm missing the documentation for (or associated files) are:

-bcolors.cpx
-icondemo.cpx
-tcache60/tcache60.cpx
-jar10.prg (increases the cookie jar)
-chkdisk3.prg (harddisk utility by Atari)
-HD_fdc.prg (step rate Auto program for TOS 2.06)
-autosort (can't find the latest version)

If you can find an ISP prepared to connect you with a modem that slow.
A lot don't like to connect anything less than a 14k4.

>2. is there a graphical interface (like "Mosaic for Atari") available for
>the 520
>
>we are both completly unsure of what's available for him. Any help
>anyone can provide would be greatly appreciated.

There are three TCP/IP stacks.

NOS is a self contained program (ie you can't write other programs to use
it's ip stack) that contains ftp, telnet and very basic mail and news.
There is a program called Oasis that is an off-line reader for mail and
news downloaded using NOS, it also calls NOS for you so you don't have to
struggle with the nasty user interface.

STiK is a simple TCP/IP stack that is limited to one dialup link (ie no
routing or anything) byt is consequently easy to set up. There is a web
browser (CAB), an irc client and a telnet client for it.

The best system is MiNT-net. It's a bit difficult to set up but it's a
proper ip layer with all the routing and everything. Once set up it
should be as easy to use as the others. All the unix clients either have
been ported or could be easily, there's a nice GEM based ftp client and
you can use CAB (with an overlay file)

1411. OASIS.Error message

Newsgroup: comp.sys.atari.st
Date: 1996-01-23 00:00:00 UTC
From: tparrett@slipper60.fast.co.za
Message-ID: <822509282_OASIS_@slipper60.fast.co.za>
Source record: 152216

I've been running OASIS for the past three months without too many problems but just lately I've been getting an error message on screen whenever I try to start a letter without entering something in the subject line. The error message says 'EXTERNAL ERROR ...Oasis module missing check installation' I've checked my installation a few times and cant find any thing wrong. I find that when this happens I'm locked out of the drop down menu items and the only way to access them is to right click in the area where the toolbox appears which causes the toolbox to be selected. I then select the phone icon. This sets the dial procedure in motion (the modem is off at this point). When the dial attempt fails I type exit,return to the Oasis page and hey presto I'm back in and the letter I tried to start appears in the 'mail to send 'box if I select 'internet'. I select the mail item,right click again which calls up an options dialogue box from which I select 'edit item' and I can then proceed as normal.Anyone have the answer to this ?.

I note that there is now a Cab mailing list. Is there such a list for OASIS. It would be useful as it would save everyone (including me) from bugging(no pun) the programmers.

I think atari are excellent machines becuase I have a
falcon myself and it has never let me down so far.

Sod those PC and Amiga's, they should be put to death.

And also those BORING adverts on the TV about the shitty intel
processor, motorola are the best!!!!

Atari deserve to survive the war of new consoles and live
happily ever after.

Cheers,
D,Rutherford

P.S. You can contact me if you like as I have a lot of atari
software ready to be run.
(ATARI RULEZ)

1414. Environment vars and Lindner Tex?

Newsgroup: comp.sys.atari.st
Date: 1996-01-23 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <4e2u64$ah9@ccshst05.cs.uoguelph.ca>
Source record: 152219

I recently got myself the latest version of Lindner's BigTeX, and am using the 020/881 compiled version on my TT. Now, I'm attempting to "patch" this on top of my existing and functional CS-TeX system, which shouldn't be much of a problem. However, when I tried to run Lindner's initex on latex.ltx to get a latex2e setup, it appeared that it wasn't checking the (presumably standard) environment variables I had set up for CS-TeX. Does Lindner's use different environment variables? If so, what are they, and if not, why can't initex find the latex2e files which CS-TeX can? I suppose I can type in all the paths by hand as latex2e compiles, but that'll be really annoying, especially with all the font definitions...

There also is Cypress, a word processor which is now being
distributed as Shareware - in former times it was commercial.
I think there is at least one ftp site where you could get
it from, but I can't recall it right now.

Greetings,

Christoph

: stylus 720dpi printer especially since the newer HP printers have to work with
: Windows to get best results. What paper & version of Calamus SL have you got?
: How did you get it to work so well with the HP660C? Any idea of the difference
: between the HP and the Epson?

I only used ordinary paper, DJ550C driver, color separation CMY (not K!), and
DJ550C correction curves on printing (linearity module!). So, far from perfect
settings for DJ660C - but the results are great =) ! The CSL-version is from
year -93.

I had bad results before I tried linearity module and told CSL _not_ to use
K-color when printing! Text still comes out black, as usual - but pictures
no longer are too dark. I think, with an optimal driver & linearity settings
for 660C, we will have very nice printouts.

And Epson.... Sorry, I don't know about that =(

Or alternatively wire up a RCA plug to the video out and ground pins on
the ST's 13pin DIN monitor plug. Should plug straight into the back of the
VCR - or into a SCART adaptor as found with camcorder cable kits.

Works quite nicely with my old STM. Good picture quality - and videos well.

:-)

No, it is another rewrite of the AES. MiNA has not been finished yet, N-AES (which was called Sigma) has been. There are two other rewrites in progress: Craig Graham's XAES, and Christer Gustavsson's OAESIS. Both are incomplete ATM.

AB> There is an undelete function in a program written by Atari
AB> that seems to work fine (and fast), it also hasn't recked my
AB> HD in yet.

I believe that ST Tools works just fine - I'll bet that you tried to repair or optimize a partition that didn't have enough room for the operation, and the well-known TOS bug that writes past 'disk full' got you. It got me once or twice that way. I use the 'Sentinel' from John Eidsvoog (freeware) to try to prevent this. Perhaps the author of ST Tools should rig up a bug fix (Stephen Cornio, are you listening?). It is possible that Diamond Edge already has one. Anybody know?

In answer to the original question - I have used undelete.ttp a few times, and it works okay. It came with ST Format's Knife ST disk. I don't know whether it is available for download.

s>
s> I used Warp 9 for years and have had no problems and VERY satified with
s> it. I hear a lot of rumored bad press about it but not many facts.

I used QuickSTe for years with very few problems as well. The only things
that I found didn't like it are WinX, 2in1 and Kandinsky. However, *I*
didn't like WinX or Kandinsky and I found the refusal of the 2in1 author to
work around it very unhelpful.

I use NVDI now by necessity rather than preference due to my graphics card.
I'm having to change over otherwise reliable software to fit in with it, I
find.

Of course, QSTe doesn't also have Speedo capabilities so it looks like I'm
stuck with NVDI (and I upgrade it regularly).

Just my personal opinion...

1435. Do I have a virus??? :((

Newsgroup: comp.sys.atari.st
Date: 1996-01-23 00:00:00 UTC
From: andy@urban.prima.ruhr.de
Message-ID: <GAXNCJAGUP@urban.prima.ruhr.de>
Source record: 152240

Hi!

Since a few weeks I've got some trouble with my Mega STE4, which I think could possibly be caused by a virus:

1. Something happened with my OASIS-pack. Suddenly I could still start OASIS but everytime I try to login to the Net, the programm won't do that. The NOS-screen very shortly appears but vanishes immediatley back to the OASIS-Menue. - It worked fine for several weeks and I didn't change anything.

2. When I was using a DTP-programm last week, suddenly everything slowed extremly down! E. g. mouse-actions were executed about 15 sec.s after the mouse-click. The mouse-speed itsself was as usual.

3. When I was printing some documents from the DTP-programm to my HP-DJ500 there were small stripes missing in several letters. These stripes were printed some lines below.

Now I'm seriously worried ... May there be a connection between these failures? Could it be some hardware-problem? or a virus?

I'd be very thankfull for some hints. Appart from that, anyway I would like to check my 540-Quantum-HD for virusses. I've got the 4.14 version of Sagrotan and the VKILLER 3.48. But I think I need an uptodate-library for Sagrotan (and perhaps VKILLER). I've never used it properly. The problem with Sagrotan is, that I've got quite a lot PD-Soft from Disks or Mailboxes. When I use Sagrotan, it very often says: May be a virus ... - but needn't.

So - does anybody know, where I could get a good library for Sagrotan with all the newest virusses and healthy programms in it? Or is there any even better Virus-Checker then Sagrotan? Where can I get it? And: is there a FAQ about virusses on Atari-machines? - What is the best way of checking - and possibly: cleaning ... - a complete 540-HD?

Thanks in advance for any help!

Andreas

1438. Educated Comments on oAESis & XaAES

Newsgroup: comp.sys.atari.st
Date: 1996-01-23 00:00:00 UTC
From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <4e3ak0$hin@whitbeck.ncl.ac.uk>
Source record: 152243

Well, I've been having a scoot through the oAESis source code, and here's a
few thoughts from another AES creator......

The code looks very nicely layed out :) - I think folks will find it easier
to get to grips with than XaAES (more on that later).

The actual system still needs loads of work (in common with XaAES, but I
think I'm slightly ahead on that one).

However, the method used by the two systems to multitask is radically
different.

oAESis seems to use multiple 'threads' within the AES kernal, running under
the pid of the client process's (note to Christer Gustavsson et al: ditch
that massive switch/case statement for interpretting the op-codes and go
for a jump table - it's faster, and all AES calls pass the standard AESPB
structure anyway).
Not a terrible way of doing it, although I'm dubious about letting other
process's loose to far into my kernal (it forces you to do a lot of data
structure locking, but does let a couple of entirely distinct functions execute
simultaneously).

XaAES takes a different tack to this by having an AES command pipe, where
the low level handler just drops AES commands + pid's of requesting
clients into a command pipe, then blocks the client to wait for a reply.
The AES runs as a server process that reads commands from it's end of the
pipe and executes them (in the same way as W and X-Windows do with
sockets - maybe I'll move to sockets at a later date).
This does allow me to do no-blocking AES calls - the client can (say)
request several windows be opened (this never fails, as long as there is
memory left...no window limit), but if it does it as non-blocking mode
calls, it won't be blocked & won't recieve a notification that the thing
was actually done. Another available option is to have the client do a
non-blocking call, but handle it's own reply pipe so that it gets
a notification of the completion of the call......

Anyway, different approaches, I don't know which is best.

The object handling in both systems seems roughly comparable, although
I'm dubious about a couple of minor points (I won't raise them here, if
Christer wants to get in touch we can natter about it).

Other than that, oAESis seems a fairly standard implementation of a GUI
(I work on low-level OS & GUI design for a living).

I'm sure it will go down well with the general public when it hits the
streets.

...but I'm also sure the techie's are going to fall in love with XaAES instead 'coz I've spent some time thinking the internals over so that scope for expansion is built in (things like dockable toolbars are a doddle to implement). But this does mean that some of the code is a little more tricky to follow.

We'll see.....it was interesting to see the 'competition' code, and in response I promise to release my beta code in the next week as well (god - what have I said).

Maybe we should get an AES/GUI development mailing list going as I'm not certain the GEM list or the MiNT list are the place to discuss the issues involved here...but here's a few that are on my mind:

1) Extending the call mechanism (non-blocking, etc)
2) New widgets (why limit ourselves?)
3) Custom widgets (linked to point 2, but allowing clients to add new window widgets themselves, like dockable toolbars (I know, I must use MS Windows to much....but it does have a few nice points))
4) Redraw optimisation & background storage
5) Extra object types (popup icon bars, popup menus, scroll lists, etc)

Anyone with views on these things should start writing NOW, to this group, to me, and to the authors of oAESis, so any new features can have the support of TWO AES systems.

Craig.

I don't know, but it reads a setup file with most of the paths in. I think
it's called texsetup. There should be a sample one included, it needs to
be put somewhere TeX can find it (current directory, there might be an
environment variable to make it look elsewhere, I can't remember)

1) Ever played Scorched Earth on the PC? Does a comparable game exist on the st? if not, i think i want to write one cause it is one of my favorite games, and i am looking for a nice starting project for my foray into programming for the PD. any feedback would be appreciated (and that includes other suggestions for what might be a cool first project)

2) I need 3 things (well more, but for this post, 3)
TOS 2.06 ROMS, a PLCC 68881 math coprocessor, and an adSCSI device of some kind (the old one sans clock will do just fine).
if you have any of these you would like to give me (or virtually give, like some dollars) that would be great. just email me

thanks

rhett@wpi.edu

1444. ST stuff for trade

I have a bunch of ST stuff I acquired when I bought the remaining inventory of a defunct Atari service center. Included were several service manuals, an ST diagnostic board, several single sided drives in cases, a supposedly working 520 with power supply, and numerous IC's. I'm looking for a low capacity hard drive (for ST) to use for loading MIDI sequences quickly on stage. Let's talk! This stuff is just lying around and should go to someone who will make usea of it.

Yes, I found my system unstable too (MSTe/Matrix CoCo/NVDI3.02Matgraph). I
would expect that editing the ASSIGN.SYS into something more acceptable would
do the trick - I can only see that the problem would be in there BICBW.

On the Toad Web site (www.toad.com, I think) there is some MagicMac material, including a program (which only works in the ST High compatibility mode) for changing one's keyboard mappings.

But it only works on the standard keyboard, not on the extended one which I have. I'm looking for an answer to this, too.

In the January issue of Atari World, there was a review of Platon. The reviewer(s) were impressed by the capabilities (yes, it does do autorouting), but not so much by the price: several hundred UKP. It is, however, a heavyweight commerical package, and you need the capabilities, I guess you need the capabilites...

> whatever you called. Perhaps the newest version has some improvements - I don't
> know.

MultiTeX was designed to work with MultiGEM, a long-forgotten multitasking system for the ST; hence the name. It doesn't multitask in and of itself, and unfortunately the shell (TSH.PRG) seems not to like MiNT: it keeps trying to access drive Q:. The shell program does so little I keep telling myself I should write my own MiNT-friendly version, but I don't seem to be listening ... a MiNT-friendly, TeX 3.14159/MF whatever version would be very nice.

Not necessarily!
If you modify the drive (slightly) depending on which drive you use
you'll be able to use the "old" Atari type eject button with your new
drive.
Check out the FTP site I mentioned in the previous posting;

If you want to buy it new then Top Byte Software in the UK had just published
Super STario Land which is as near as you can get. If you want a copy then send
a cheque for 21.5 UKP (or 11.5 UKP for STario's Christmas) made payable to
Top Byte to:
TOP BYTE Software
3 Sailsbury Road,
Maidstone,
Kent,
England,
ME14 2TY.
And tell them that Paul Womar sent you.

>2 It did *not* come with Epson Stylus drivers, and in spite of
> Toad's display ad claiming "Any Printer" I think the printer
> list is rather thin.

I wouldn't consider the list of printer types supported as "rather thin".
Many/most printers offer a choice of emulation modes, offering the chance
of using a well known command set such as Espon LX-80, if the
manufacturers own command set is not supported.

With Soft-Logik not supporting Atari Pagestream any longer i'm not
surprised that it's difficult to get hold of more modern drivers.

>3 I also have a Migraph hand scanner, and so far the 300/400
> dpi allegedly 32 level grayscale TIF files look like crap
> through the various viewers I've used and haven't yet printed
> out anything close to the photographic/newspaper quality I
> was hoping for. This may be due to the driver problem, as my

I too have a 300/400dpi handscanner, though i'm not sure it's made by
Migraph, but it did come with TouchUp so it could just be a badging thing.
My scanner can recognise 256 greyscales and have had no problems getting
reasonable laser-printer reproduction. IMO (and IME) a dot matrix printer
is not too good for printing monochrome scanned images, except maybe
line-art. Have you tried a different format other than TIF? IIRC there is
something in the manual about working out the size of the scanned/cropped
image, related to the scanning size and output quality - did you follow
these guidelines?

> the dithering problems I've been warned about. Will reducing
> it damage the quality or is the problem mostly enlarging it?

Both will give less than 100% quality, when compared to the original.
Enlarging and reducing only becomes reliable when vector-art (such as for
example Easy Draw .GEM files) is used. If your images are not too complex,
have you tried vectorising or autotracing them?

>4 Last night nothing (first time) on the "Style" menue would
> work. I highlighted some text, dropped down the menue,
> selected "bold" and it blinked but did nothing. It's locked

This is because, as i've found outin the past, a style tag had been
applied. A style tag will take prefernce over an individual command if it
has been set. ISTR 'normal' (in the centre/top) in the tag/style dialog
will allow all the text styles too be changed again.

After years of use i still get annoyed by the way the tags are handled.

Btw, there is a fast load flag in MagiC in case this is useful.

C_TEX works very well for me under MagiC (Geneva doesn't like the way it calls the .TTP progs, or it doesn't like the TTP progs themselves or something!).

With Magic though, no probs. From memory, the Lindner shell looks better but doesn't do anything form me that I can't do from C_TEX. Plus, C_TEX can output a file directly to Tele-office (maybe also Office Junior). Great. Really Great.

There are a number of utilities which can be run from C_TEX, I use Thunder, a great image converter which writes the TeX include file, TEX2TXT and a few others. If any of these are of interest to TeXers out there, send me some email.

1473. Speedo BJ10e driver problems

Newsgroup: comp.sys.atari.st
Date: 1996-01-23 00:00:00 UTC
From: awood@f030.demon.co.uk
Message-ID: <822424396snz@f030.demon.co.uk>
Source record: 152278

SpeedoGDOS Canon BubbleJet 10e printer driver problem:

I'm wondering if I have an up to date version of the above driver
or whether the problem I'm getting is my end -

Whenever I try and print any document that has text styled with
'outline' set always causes the application to crash. Papyrus calls it
an internal bus error, WordFlair II dies completely as do others.

No problems are caused by Bold, Super/Subscript, and Italic although
'Light' certainly gives some odd results on paper (but doesn't crash)
and as for Underline - I very rarely use it anyway!

I've tries several applications using SpeedoGDOS 4.1 and 5.0b&c with
the same results on both a Falcon and ST

Comments would be gratefully received.

>Commercial software might also do. Any ideas?

'Scooter' IS commercial! I found it in my catalogue from Indigo 2 in
Denmark where it cost (the catalogue's from july '95) Danish Kroner
1295,- which is roughly around UKP 130,- I'm not sure what that would
be in Finnish Marks.

There's a colour and a black/white version around, and they're both
supposed to be excellent programs. That's all I know.
Hope that helps.

1475. Re: HELP SAVE ATARI -- Please Read!

Newsgroup: comp.sys.atari.st
Date: 1996-01-23 00:00:00 UTC
From: L.J.Sak@kub.nl
Message-ID: <L.J.Sak.3.3104C8A8@kub.nl>
Source record: 152280

Hi all,

Just wanted to say a few words about Atari:

It's a shame it went all this way. I am still a fan of the machines
and will ever be (and always was). It all began (my part) in '83, when I
bought my first XL. Some 2 years later I bought the ST series, and
lived the years of ATARI victory, when almost all games magazines in
the shop were ST mags, and they florished. These were, let's face it, the
best years till now. They supported their products, but even then failed
to support their developpers.. What is a computer without good software in
the future (we have great software, but that is not due to their support)...
Then they lay low for a few years, indeed, as mentioned in other mails
regarding this subject, swimming in their success of the past.. No or
few minor developments were done and other brands gathered up.
They had/have better products, but their management fails to match it. Shops
dropped out, softwarecreators started developping on other systems etc.
But things were not going that bad, still.
Then the Falcon came, and ATARI (will always be my capital word :)) promised
better times and full support to anyone who wanted to share the development.
This they did for almost half a year, winning trust from shopkeepers and
things started to look great. Good software was visible at the horizon.
Suddenly they totally backed out, dropping virtually all support. ATARI
Germany (being the best/active ATARI point in Europe) was disbanned and
full controll went to the Netherlands (who indeed had the worst: management
did it again (read: they f*cked up)).
This decision was a fairly hard deathblow to ATARI support in this continent
and having totally dropped their DTP-support (one of the strongholds of ATARI)
German shops, who were most fanatic, started to drop their support too.
But still we remain. I am sorry if I can't make this (true) story a bit
more sunny, but that is just the way I see it.
Atari is at it's last breath and can only survive if management at California
is TOTALLY restructured.. A new leader would be appropriate.

It is a great machine, with great potential. It still has great advantages
over other systems, having smaller more efficient programs, consuming less
resources etc. It's a shame that marketing does the job in computer-world.
We need only look at microsoft (yes, small letters are on purpose), who
manage to support very weak and flunky software using their superior
marketing power.

It s*cks. WE NEED CHANGE

So let's all snail/mail/fax/phone/travel to ATARI, folks
I sure will,
I want to live, not exist,

Ludo Sak,
L.J.Sak@kub.nl
.

1479. Gemini 2 ?

Newsgroup: comp.sys.atari.st
Date: 1996-01-23 00:00:00 UTC
From: phil4@phil4.demon.co.uk
Message-ID: <822525020_OASIS_@phil4.demon.co.uk>
Source record: 152284

Does anyone know where I can download/get a copy of Gemini 2, or even the slightly older version 1.99, in English ??? I know its not that difficult to figure out in German, but Gemini is one hell of an advanced desktop replacement, and as such there are so many hidden features and settings that trying to utilise them in German is damn near impossible.

I have seen at Hensa, a UK version 1.2, but I'm looking for something a bit more uptodate, to use with Geneva, and not quite as expensive as Neodesk 4 or Ease.

Thanks for any help, in advance !

Atari have shown on several occasions they have the 'meddle as a computer innovator' and this is to some extent their problem. Remember the STBook, STPad and Panther (predecessor to the Jag). While others, like C= and the PC industry, reinvested any profit back into the their successful lines, Atari and the Tramiels jumped onto any bandwagon they could find and announced some ï¿½vapourwareï¿½. Some made it into reality but usually to little to late!

I know C= went bust, but that was their PC side screwing things up. Even I, a true atarian, have to admit the Amega developed into quite a system compared to the Atari ST/TT. Just think what the Atari line could have been without Tramiels short attention span, maybe we would have had the Falcon earlier or some development of GEM/TOS, sorry just fantasising ;-)

With hindsight, this may become our strength. As Atari failed to produce faster/better hardware and software (OS), others have stepped into the void. As well as some excellent hardware upgrades (accelerators and graphics card for example) there are several sources of replacement OSï¿½s. The Apple market is looking to flourish with the licensing of the MAC HW/OS, so could the Atari market with sufficient support to those developing the HW/SW.

So support them, encourage them to work together to develop a common platform, API and user interface, and the Atari market can remain at the forefront of ï¿½computer innovationï¿½.

Andy.

As one of the makers of 525 I can say, that we indeed have the code for
decoding mpeg, but not yet for coding. (not implemented in 525 though).

But it is not really true, that PC/MAC can play or create Mpeg sounds in
realtime - at least I haven't seen this without additional hardware.

If we would build that feature in 525, we surely wouldn't use the DSP
because 525 is supposed to run on all Ataris and even on other
computer systems. As 525 is only a converter, you still have to
unpack the sounds if you want to hear them...

I'm not sure that the Falcon could do that task in realtime (well,
depends on the sample rate).

>of the partition (this would be physically impossible).

But all drivers for the atari pretend to have larger sectors. TOS limits
the number of sectors not just the number of clusters AIUI, so to handle
large partitions they group the physical sectors whch obviously are of a
fixed size into larger logical clusters

> but it didn't unhook the phone).Can it be that i'm using TOS 1.0?
>
That might very well be the reason. But first check for interference with
other resident programs : Accessories, AUTO-folder programs etc.
by disabling them subsequently and rebooting.
If you have none left, then you should think about an OS update.
Or better : Think about it immediately, as TOS 1.0 is so bloody buggy.
The easiest sensible replacement is TOS 1.4

Cheers Peter

Hello!

I`ve got the registered version 3.10 of CoMa fax-program. The problem is, that when I try to send a document written with 1st Word Plus, CoMa tells me that "There`s no fax-files in the folder!". This is especially annoying when I`m trying to send serial faxes. I`ve changed all the appropriate parameters to point to the directory where I`ve got the .DOC-file I want to send etc... Got any idea what could be wrong..?

I've got a little crib sheet on setting up a basic MiNT-Net installation
if anybody wants it (it was acidentally posted last week ;-). It could be
considered the bare minimum - however you do need to set more up to get
a connection to the 'net going with it. All I was doing was connecting 2
machines together over a fixed serial line.

Re; problems with STiK.

IRC: Same thing happens to me. I believe we have to find an IRC server on this side of the atlantic. Back when I first installe dSTiK I popped onto irc with the default. I played around for 10-15 minutes then left. Then when I tried it again recently when bored, The server tells me I have no authorization. So I'm just guessing here, but my bet is they've started blocking access to users from the U.S> or N.A> to be more accurate. Could be wrong though. Don't know much about it.

Telent: It takes some time to negotiate the handshaking when connecting with Telnet. When it gives you the Connected message, it is connected however it now has to negotiate with the rmote host before you can log in. Sometimes this is painfully slow. I found that hitting a plain return will often help it out. If nothing else it will keep the other end from timing you out during login.

Cab: Sounds like the problem I had for awhile. I'm not certain exactly what I did to fix it though. I used an old version that still worked for awhile then unarchived it all again in a different spot and it workeded.

Another problem I have noticed is that sometimes, I will have to reboot my computer to use the connection. It's not often, but with this and crashes, I've rem'd out the ATH line in the script. This means I have to manually hang up the modem, but when I rebotot I can just press enable and then connect and space bar through it all. Then miraculously it works.

It appears to be _some_ GIFs. I don't really know which or why - some
sites you can use, some sites you can't. On a lucky day you'll miss the
bad ones, on an unlucky day nothing works. The only sure way is to disable
all graphics, which to me seems like missing the point of the WWW.

I had similar symptoms with my Falcon after I had
opened my tower case to examine some connections.
It turned out that a loose connection on the floppy
drive cable was responsible. Has the machine been
opened (or dropped!) ? My problem was solved by
simply re-connecting the plug on the ribbon cable.

First get some decent driver software, that supports the XHDI
protocol. Set the ID of your minix-fs partition to RAW, clear
the first sector of this partition, than run minit again.

BTW a 512MB minix-fs is probably not a good idea, because
the total number of inodes is limited to approx. 2**16. You
might want to use a fastfs or ext2fs instead.

I've been looking around, but having to spend another 75$ just to be
able to _use_ my harddisk the way I want seems rather steep to me.
Aren't there any shareware HD drivers? (Guess not, huh?) So far I've
found HDDriver and SCSI-tools advertized over here, only HuSHI seems
to be missing. What does that one cost?

>protocol. Set the ID of your minix-fs partition to RAW, clear

Ummm... I'm using MiNT, not Linux. Or is there an ext2fs for MiNT
already?

Otherwise, I'll just try to repartition my HD, and see if it works
with a 256M minix partition or thereabouts.

Andrew Owen (andrew.owen@gecm.com) wrote:

: Atari have shown on several occasions they have the 'meddle as a computer
: innovator' and this is to some extent their problem.
: Remember the STBook, STPad and Panther (predecessor to the Jag). While
: others, like C= and the PC industry,
: reinvested any profit back into the their successful lines, Atari and the
: Tramiels
: jumped onto any bandwagon they could find and announced some vapourware.
: Some made it into reality but usually to little to late!

My point precisely. It seems to me that Tramiel et al kind of viewed their computer line as their claim to respectability! They took a kind of "Look what we can do if we *want* to! type of attitude. Develop a great machine...abandon it...develop another great machine...abandon it...and so forth. in the interim play around with game machines and rake in an immeddiate profit. What they lacked is a sustained effort and dedication.

: I know C= went bust, but that was their PC side screwing things up. Even I,
: a true atarian, have to admit the Amega developed into quite a system
: compared to:the Atari ST/TT. Just think what the Atari line could have been
: without Tramiels...

A viable incredible platform with commercial software and corporate support? Nah... That would make TOO much sense! ;-)

: ...With hindsight, this may become our strength. As Atari failed to
: produce faster/better hardware and software (OS), others have stepped
: into the void. As well as some excellent hardware upgrades...

Again, i have to agree with you here. I've always been thankful to those who have taken it upon themselves to do atari's work for them--The independent HW designers and those saints that give us great PD and SW software. Maybe Atari grew complascent because of their efforts. ie. "Why should we spend the money, when the users--themselves--are probally doing a better job than our own people!"

: So support them, encourage them to work together to develop a common platform
: API and user interface.

Wasn't that what GEM and VDI were originally about and why both apple and atari originally implemented them? A case point would be something as silly as "mouse-ka-mania"...Ever wonder wher those nifty mouse pointers came from? they were ported from the Mac. Take a good look at Calamus, if you own it, and then look at a similar Mac product. The similarities are amazing! At work we use Macs and run filemaker pro (a database). The

icons in "layout" mode seem strangely familiar. The maverick was IBM and I'm sure that there isn't a day that goes by that the ceo doesn't kick himself in the butt! Because of Big Blues refusal to adopt vdi and gem, Bill Gates made a fortune on a poorly conceived atari/mac os emulator/overlay!

: and the Atari market can remain at the forefront of
: computer innovation.

I'm afraid that it's too late for that...

1514. What would your DREAM Atari computer be?

If you could create your own Atari/C-LAB computer, what features would it have?

Personally, I'd love to have video hardware capable of 1024x768 non-interlaced with 24-bit color.

LOTS of RAM expansion (4 gig).

Expansion ability. (PCI bus)

Separate Keyboard/rackmount case.

68040 or up -or- PowerPC.

Cleaned-up operating system...

Sounds as if your drive has just totally failed. Open up he case
(if you dare) and check all the connectors are still in place. If not
then you'll probably need a new drive. It shouldn't be too expensive.

I've recently downloaded WWW116.ZIP for the Falcon. Although it seems as though CAB has improved quite a bit I still frequently get bombs (2 bombs), lockups and I got one runtime error. Can anyone think of why I am having so many problems? Maybe a conflict between programs? Although I have run STiK and CAB with a pretty clean system (FPATCH and XCONTROL).

There are programmes available but I think that the easiest way is for
him to connect to a private BBS with Internet EMAIL access and use
that. It is a bit slower but it depends on how important it is to be
fast and the degree of skill he has on the Atari.

1523. MagiC 2.0 > 4.0 Upgrade?

Newsgroup: comp.sys.atari.st
Date: 1996-01-24 00:00:00 UTC
From: <>
Message-ID: <4e6b6d$ve@nw002.infi.net>
Source record: 152303

I just talked to the people at Toad computers and they are quoting a price of $45 for the upgrade. I thought someone else had said the upgrade would be $29. This is rather annoying since I just bought 2.0 from Toad less than 3 weeks ago. It would be nice if there was a reasonable upgrade fee. I paid $69 for 2.0 and 4.0 is listed as $99 so $45 for the upgrade is too much, in my book. Anyone know of a cheaper source for the upgrade?

A cab.ovl similar to slipknot is currently under development by the same guy
that made the cab.ovl for MiNTnet. Although this is not a perfect solution,
I would really like to see this, as I have one SLIP/PPP dial-up connection
(Which is busy all the time...) and five terminal/shell accounts.

>Do you have ICD Pro ???????

Yes. It is the version 6.5.5. I also have been trying to reformat the
original IDE drive, having backed everything up on the new Gig Scsi
drive. I run the ICDBOOT program, then ICDFMT to format the drive, then
I have tried a few different partition schemes. I like all 84M on 1
partition, but I have tried other schemes. It bombs on the Partition
process, after doing the test for bad blocks. The partition doesn't
stick, and if I try to write it again, it says not formated by ICD.

Both are generally true, I think, but another reason is what has been called
"creeping featurism", adding more features with every release in order to
outdo your competitors. Even when some of the features are useless to the
majority of users.

When I say 'innovation' I don't mean 'State of the Art'. For example, I hope it's not beyond
people like C-Lab to put a power-PC or 68060 (when it finally arrives) into the Falcon. I also
understand that it was considered to re-write the MagiC OS to run native on the MAC Power PC
platform.
I've just read treads on hardware fixes to increase the speed of the Falcon Bus and DSP chip,
if these could be incorporated into, lets say Falcon III, then we would have a platform which
is keeping pace with the PC. Then there is the Eagle and Medussa, bigger, better faster
versions of the TT.
I'm not made of money, but I'd be willing to pay for the ability to do what I do now (DTP,
Imaging, Programming, etc) but faster with more space and colours.

There is a thread "What would your DREAM Atari computer be?" by Robert Withoff, mine would be:

Falcon (or compatible) with
68040 32/64 Mhz CPU or better,
DSP 50Mhz
4-64 Mb memory,
Graphics up to 1024x768x8 (256 col) with more colours at lower resolutions
(800x600x16 (65K Col), 640x480x24 (16M Col))
Bus expansion (PCI?)
SCSI II, 1.44MB Floppy
Separate main box/keyboard (a'la Falcon II -X *** Well done C-Lab)

Decent OS (MagiC, NVIDI, Kobold, Ease on ROM)

With the above, I think I could do anything friend could do on their Pentium PC's, one just bought for UKP 2500.

We may not with the tech race, but could come a good second.

Andy.

Hello all. I've just acquired an old Mega STE (with no manuals or software) and am wondering what I can do with it. Peeking under the hood, it's got a 16MHz 68000 CPU. I originally got the machine in the hopes that I could run Linux on it, but the Linux/M68K FAQ says otherwise. :(So now I'd like to know what I can do with this machine. It's running TOS (I can't tell what version...where should I look?) and the GEM desktop. Is there any way to upgrade it to make it "Linux-able"? Is there any other OS or desktop to make it more UNIX-like (multitasking, etc.)? Is there any software available for this beast? In short, I'd like any information or pointers about it. Thanks much in advance.

-Jason
(orendorf@cs.fsu.edu)

I assume it uses something like term or tia?

Anyway, I can't see much point in having anything other than SLIP or PPP, it
would greatly restrict your choice of ISP.

1540. Hard-Disk

Newsgroup: comp.sys.atari.st
Date: 1996-01-24 00:00:00 UTC
From: steve_w@atlantis.actrix.gen.nz
Message-ID: <DLoF5D.Fsp@actrix.gen.nz>
Source record: 152320

Much to my displeasure, my old Megafile 30 died the other night, with the hard-disk (A seagate ST-238R) siezing completely. Losing many hours of graphics work, typing and gameplay.

However.... I had an old 286 laying around which just happened to have an old MFM hard-disk in it. What the heck I think, and I plugged it in, and formatted it, and it works perfectly. I've so far managed to format it to 60Megs without errors.

But, I'm only using a rough guess, the ICD software doesn't have the spec's for this particular drive, so, I need the information for:

NEC D3142

Near as I can tell, it's an MFM drive, but could just as easilly be RLL, (I don't know how to tell the difference, and the drive itself doesn't say).

I need the number of heads (Is at least 8 judging from format success), and the number of cylinders (at least 615 from same success). The figures for RW (cylinder at which Reduced Write current begins), PC (the cylinder at which write precompensation begins) and the step-pulse width would be nice, but not necessary.

I can successfully format it using the figures for the NEC D5146 from the ICD config listing, which has 8-heads & 615 cylinders, but I figure I might as well get the information right, especially if it gives me another couple of megabytes of storage.

Can anyone tell me the spec's for this, or tell me where I might be able to find them? (NEC's homepage was of little use)

> then boot TOS, if !0 boot Unix (_IF_ there is an SVR4 on your TT).

Zero indicates no boot preference, just boot the first available
operating system. Currently the following values are defined:

0x80 => TOS
0x40 => ASV (Atari SysV)
0x20 => NetBSD
0x10 => Linux

I think it is actually because ICD doesn't stick to the official
guidelines. ST Tools reported that most of my HD was corrupted in some
way. It wasn't although it was after it "repaired" it.

I don't suppose you know what "TYPE" of drive the old PC was configured to.

I remember seeing a list of the IBM drive types (0-78) which gave some of
this information. If you could check the CMOS setup in the PC, the type
should translate to a list of heads & cylinders at the very least.

Source record: 152328

Hi,
here is Gabriel from Florence, Italy.
I have a Falcon and I plan to use it for multitrack
HD recording, so I need to buy a "big" (1 or 2Gb) hard disk...

I need some advice on which HD to buy...I know that some people
here use the Falcon for HD recording: which HD do you use? Are you
satisfied with it?
If you will be so kind to e-mail me any information
on this topic (and possibly the specs of the HD you use) I could put
together a list of "approved" hard disk drives and then post it on the
newsgroup...

All the best,
Gabriel

> all that stuff?
>
The bare minimum of a MiNTnet system just consists of MiNT, the
socket.XDD, the particular *.XIF for your hardware you intend to use as
an IP link, and some small config files. Alltogether about half a
MegByte, I'd say. But add a couple of tools to set up the links andto
administer them : Another half a MegByte.

So you can run it from a floppy disk, if you want to !! (Not recommended,
of course !) But you need a little crafting , since you cannot use
slattach, as this needs a unix directory structure and auxiliary
programs in their correct places.

> Also are there any recent (3mnths or so) docs that improve on the originals,

It's just another reason to make me want to get rid of this Falcon. I've had it since it was first available in the US. I only use it for a few things now. 90% dumb terminal (to get onto the Internet) and 10% play MODs and create MODs. You can put a fork in this Falcon...it's done.

I'd like to see that. CAB/STiK are the only new things to come around that would give me another use for my Falcon that I'm interested in.

1554. Strange behaviours of STiK/CAB

Newsgroup: comp.sys.atari.st
Date: 1996-01-24 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <DLozx8.HAE@freenet.carleton.ca>
Source record: 152334

Well, I think that I have isolated my STiK/CAB problems. I have Stik set up, it dials, logs me in, starts slip, gets an IP address that seems valid, and lets me get on with using the net.

So far, so good. When I try IRC, I alwsy get disconnected with an EOT or EIF (I think) from the host, usually after around 30 seconds in IRC. When I try the telnet app, it looks up the DNS, then says I'm connected, then won't do anything. When I close teh connection, it tells me that it had a time out error.

Whjen I run CAB, and I try to open a URL, it look sup the DNS, gives me a connect to host message, then stays at loading 0 bytes until it times out.

I do have hsmodem 06 installed correctly, using mfp.prg on modem 1 on my megaste at 19200 with a USR 14.4K modem. Do you have to run an acc to set RTS/CTS, or is this handled inside of STiK? I have tried it both wasy, same results.

As far as I can tell, I am connected to my provider, the DNS lookup is working fine, and I am able to get to teh IRC host. Why I get disconnected/timed out, I have no idea!

I presume this was aimed at me.

While I respect your sentiment - pointless bashing of non Atari stuff doesn't help at all. Atari is neither a god or a religion - and even dedicated Atari owners (like myself) have to (IMHO) look at the situation and make a fair assesment.

Quite honestly (IMHO) Atari don't deserve to survive the war of the new consoles. Just being 'Atari' is not good enough anymore. Unless they actually make and sell something that people want - they might as well not exist. The last machine they actually tried to sell was probably the STE. The only machine they have IMHO made a good job of selling was the original ST(F)(M). The MSTE,TT,Falcon and Jaguar have not had the market penetration they could have had. Overpriced and undersold.

Atari are just a company of broken promises. It doesn't matter now as we have a thriving 3rd party industry to supply our needs. However the fact we have survived is no credit to Atari.

Roland.

This is all mouth watering stuff ... but ... what about compatibility? A feature of Atari GEM has always been backwards compatibility. It would not be a good thing to create a brilliant interface if applications written to take advantage of it will not run on the other GEMs (NAES, Magic), let alone TOS 1.6! How are the problems with cross compatibility and backwards compatibility going to be addressed? I can understand that you don't want early GEM to be a millstone around your kneck, but creating various incompatible strands of GEM would shoot the Atari market in the only foot it has left.

There is a Calamus modul available called "Bridge". This modul exports any Calamus file into a variety of different image formats including EPS und PS, you can even print on PS printers this way.

You're talking about cluster size, aren't you ? Sector size is the same
on both Minix and TOS, being 512 bytes, also not growing with the size
of the partition (this would be physically impossible).

1564. Falcon030 disc drive icons vanish, cannot access disc drive

Newsgroup: comp.sys.atari.st
Date: 1996-01-24 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4e4skn$ohb@status.gen.nz>
Source record: 152344

A Falcon030 which was previously working without problems has
exhibited the following symptoms:

After booting from the internal IDE hard disc drive as usual, all
looks fine once the desktop is reached. When, however, the floppy
disc A icon is opened, an error to the effect of "The disc drive does
not exist" appears, and the floppy disc drive icons A and B vanish.

Discs simply cannot be accessed in any way.

When booting from the floppy disc drive, with or without a floppy
disc in it, no floppy disc icons appear on the desktop at all.

The floppy disc drive LED does illuminate after power up, but the
floppy disc drive itself does not spin or show any signs of life.

Any ideas as to why this is happening and how to fix the problem will
be much appreciated.

There would have been none, Jack Tramiel saved Atari from closure. At the
time Atari was driving Warner into the ground, to the extent that Warner
would have simply shut Atari if Jack hadn't bought it.

: A viable incredible platform with commercial software and corporate
: support? Nah... That would make TOO much sense! ;-)

Although we may crtisicise Microsoft and Intel they do one thing right and
thats to spend money on R&D. Atari have never invested either significant
time or effort in this.

The STe was already out of date in comparison to the Amiga when it came
out. The Falcon was 12 months behind, and although it was ahead of the
Amiga 1200, it's OS was essentially TOS with a PD utility (MiNT) bolted
on.

Also Atari SHOULD have released atleast a 12 games and apps which
were Falcon specific when it was launched. Although there is now
a trickle if Falcon stuff, it's too late.

: I'm afraid that it's too late for that...

Yes.

SM> You need special Atari RAM, or you could buy that gadget
SM> which allows you to fit SIMMs - but I've heard that it
SM> causes screen interference.

The card that can cause interference (and not only with the screen -sometimes it can disturb the drive and internal HD as well) is the Falcon Wing, but I believe it has been fixed on new cards. However, the Wing takes four 30-pin SIMM:s and nowadays they're more expensive than 72-pin SIMM:s.
I have another card, that takes one 72-pin SIMM and fits exactly in the same place as the original memory card and with no interference problems at all.

SM> As for memory, once again Atari machines have the "advantage"
SM> that almost
SM> all software is written for 1MB (or occasionally 4MB) machines,
SM> usually without hard disks. But PCs have the advantage of
SM> separate video memory.
SM> If you could get 1024x768x256 with a Falcon, which you can't
SM> (and I couldn't live with less)

Couldn't live with less? Some PC users don't go higher than 640*480, which is the same as the standard Falcon, and most PC users don't use a higher resolution than 800*600 (the same resolution I run on my Falcon) - the icons get too small for the computer to be comfortable to work with (if you don't have a big monitor).
As for the memory and hard disk consuming when talking about PC-programs, I'm totally convinced that it's either sloppy programming, where they don't care to optimise the programs, or it's simply very big differences in the CPU families (you know - Intel Vs. Motorola) and that can account for the extremely big PC programs and the more compact Atari programs. Everybody knows that Motorola processors are more efficient than Intel CPU's and that's why you can never compare clock frequencies between the two. Maybe the instruction code is different in the same way, so the programs simply have to take more space? It probably is, because the Pentiums are built on the same principals as the 286 CPU's - to be backward compatible!
This hardware compatibility is totally destroyed by the operating systems, because you often need separate versions of the programs if you run Windows 2.0, Windows3.11, Windows-95, Windows NT or OS/2.
I'll never buy a PC - not as long as there are TOS computers around!

Best regards,

Claes

>of the TT? I would like to go from the current 1M simms to a couple of 4M
>simms if that is possible. I'm finding 4+4 a bit tight lately. Wayne Booth

It depends on which version of the TT daughter board you have.
The version not capable of upgrade is CA400312-xxx this is 4MB only.

The version which is capable of 4Meg and 16Meg is the Atari TTFAST ram
board CA401058-xxx.
The SIMMs may be 1M x 8 or 4M x 8 (9 bit SIMMs may also be used).
All 4 SIMM slots should have the same type (ie. 1M or 4M).
1M SIMMs give a total of 4Mb of fast ram, 4M SIMMs give a total of 16Mb.

The jumpers required are as follows:
SIMM type jumper W101 jumper W102 jumper W106
1M x 8 2 - 3 2 - 3 2 - 3
4M x 8 1 - 2 1 - 2 1 - 2

Starting RAM Address jumper W103 jumper W104
$0100 0000 2 - 3 2 - 3

Address Mode jumper W105
NON-BURST 1 - 2
BURST 2 - 3 (default)

location:
| mmu chip |
| |
____
W105
W106 W104
W103
W102
W101
| | | |
| | | |
SIMM slots -> | | | |
| | | |
| | | |

All is not lost if you have the 4MB only board, if you are handy with a
soldering iron, I have instructions for converting the CA400312-xxx to
use 4MB SIMMS to get 16MB of FAST RAM.

email for details.
regards dennis

1577. First Class Client for ST/Falcon?

Newsgroup: comp.sys.atari.st
Date: 1996-01-25 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <96025.161417STIRRE31@MAINE.MAINE.EDU>
Source record: 152107

I am taking a class here that is using the First Class Client
for Macs and PCs. Now a friend of mine who was an ST fan long
before I was told me that there was a version of First Class
made for the ST. Can anyone tell me if this is true or not?
I would really love the luxury of using the BBS and doing work in
the comfort of my dorm room. I would appreciate any information
anyone has about this.

I've seen a lot of postings about IDE drives & ST's.

Now I admit up front that i've not looked into this in detail...but I was told years ago (by a guy who knew PC's really well) that an IDE interface was a really simple affair, just a couple of bus drivers for isolation & buffering.

So, is this true?

If so, then it should be easy to put together one, AS LONG AS you know the correct address locations to select & where to hook the control lines.

Is this data available from Atari Corp? (like in the developers docs)?

AHDI seems to support IDE drives, I assume that Atari must have meant this for the ST Book, but could the idea be developed into a generic IDE interface?

What are the advantages of IDE vs SCSI?

1586. suprflag Batch flag setter

Newsgroup: comp.sys.atari.st
Date: 1996-01-25 00:00:00 UTC
From: Tom Lamparty <lamparty@telerama.lm.com>
Message-ID: <Pine.BSD.3.91.960125174639.12950A-100000@ganesh.lm.com>
Source record: 152116

Solved the problem of how to get suprflag to the people that need
it! Almost all the new users of PageStream need it, and just about
everyone else can use it too! It's a batch setter of the various flags
used for fastload, run from TTram etc. Do a whole hard drive, one
partition, Several paths, one path, one file! Whatever! Lets Pagestream
start up in seconds instead of minutes! All those import, export and
printer modules are seperate programs that have to load in! With out the
fast load flags set it can take quite a while depending on how many you
have loading in each time!
suprflag.zip can be found in the pub/atarist/utilities directory
on toad.net. you can get there via ftp, lynx, or cab, I don't know if you
can get there via gopher, never tried that 8-) Of course those that have
the capability can use Netscape! Whatever you use get it! Oh, they also
have a umich mirror that is updated daily! Not to mention all the good
stuff on sale there for our systems!

In my previous post I wrote:

> >Anotherthing... My system has a modem1,modem2,serial1,serial2
> >port... that is 4 serials I counted. What gives? AlsoWhat
>
> Your machine has two mini-din style connectors. These are your
> serial ports. It also has to DB-9 style connectors. THESE ARE
> CONTROLLER PORTS. You can plug a mouse or joystick into the
> controller ports.
>

Before I get flamed, let me say that this is not correct. I forgot that the TT had the two extra serial ports. After pulling a back-issue of STart, I found the following:

```
PORT FUNCTION
------------- --------------------------------
MODEM 1 Full RS232 port (RD,SD,RTS,CTS,DTR,DSR,CD,GND)
SERIAL 2 Full RS232 port
MODEM 2 Three wire RS232 (RD, SD, GND)
SERIAL 1 Three wire RS232
```

So, what I should have said is that one should be careful no to confuse the CONTROLLER port (which are DB9 male) with the four serial ports (which are DB9 female). To correct the other error, the LAN port is the ONLY mini-din connector on the TT.

Sorry for any confusion I may have caused.

Good luck.

To my knowledge, there is no networking software for the TT, MSTE, or Falcon that will yack on a (Mac) LocalTalk/AppleTalk network. The networking protocol is _huge_ (10 layers deep), and Apple is not wont to give out the information to non-apple developers.

If anybody has a solution, please post a response. I could use the networking solution myself.

c(> : produce..?
c(> : Quite nice, actually: compressing sound into 1:5..1:10 with little loss
c(> : of quality! Are makers of 525 and such programs reading this? Can and
c(> : will this be done, or is it too hard a task for Falcon?
c(>
c(> I have been thinking about this one. I don't think it would be a hard
c(> task for Falcon to play MPEG with sound, but the non-standard audio
c(> sample rates on Falcon would mean an extra CPU overhead as the player
c(> would need to take the 44, 22 or 11kHz audio and interpolate that to one
c(> of the Falcon frequencies (50, 33, 25, 12.5kHz etc...). I am not a
c(> hardware expert so does anyone know what sort of CPU overhead this task
c(> would impose upon MPEG playback???

Hi Guys,
Now I'm not a programmer or hardware expert but try this...

Get a copy of Paula the module playing .ACC installed and then load in
a .MOD file.Start the .MOD and then quit out of Paula.Now drag and
drop an MPEG onto PLAYMPEG.TOS or MPEGDSP.TTP and see what happens.
You should be seeing the MPEG playing quite happily whislt listening
to the .MOD of your choice.

As to the CPU and DSP overheads,the MPEG framerate only drops slightly.
for example an MPEG viewed without sound played back at 10.34 frames
a second,the same MPEG with sound 8.23 fps.So not a great loss.
The framerate also depends on the frequency used in the .MOD file
playback.The higher the freq the slower the MOPEG plays back.

Now if some bright spark can combine the two you could have a screen
saver with class...anyone?

T > How do I digitise audio on the TT030? I don't believe there
T > is any audio in port (only MIDI-IN)...

Nope, there isn't. Get yourself a cartridge port audio digitizer (ST Replay is popular), and sound editing software, such as SoundLab, and have a ball. I am currently using Atari's SampleMaster in ST High Res to save the samples, and Soundlab in TT Medium (yes!) to edit them. I'm sure there are better solutions, but this is fairly cheap - just like me.

Somebody got a cheap ST Replay for sale? Soundlab would record directly from it, saving me some drudgery.

>bytes uuencoded! In the mean time anybody that thinks they need it send me
>e-mail requesting it! I'd put it on umich (if I could ever get on there)

You could put post it to comp.binaries.atari.st. I know it never gets
used but it was still there about a week ago. Best put a message in
here a couple of days beforehand because I bet there's not many people
who still have it, to give them chance to add the group.

It'll be sad if the group disappears through non use!

Btw, while I think of it - people with NOS should avoid posting
binaries via NNTP anywhere, there's a bug. That said, try emailing it
to the group with SMTP instead.

>netted.
I hope Theron means that this Slipknot program works over a normal VT100 type dialup line using Zmodem to do all the transfers. The host unix system would provide the net access through a shell. This would be a great idea, a lot more efficient than that dreadful SLIP/PPP protocol and it should be easier to setup.

Hmmm .... what would it take? A prog to take CAB requests and covert them to appropriate unix shell commands, thinks ... lynx -source http... | sz&
Lynx ain't too good with graphics, although I think it can grab gifs...
mmmH.

I saw something like this the other day. The power plug to the floppy
seems to work loose on some Falcons.

Open it up and push home the power (5-pin) plug.

Hello all

I think I know what's wrong actually. I fitted a Falcon Speed emulator to it and took it out today. Unfortunately I didn't record the position of the jumper on the expansion board (I didn't even keep the jumper but I suppose they are a standard size).

Can anybody help me out here?

Regards.

Okay, I take that back. I just did an archie on `hddriver' and found
a demo version on hensa (uploaded on my birthday :-) and read there
that the full version costs 45 DM.
Now that is an amount that I _can_ afford :-) So I'll just check
whether MinixFS will work on a 256 M partition (I won't go any lower)
and if not, I'll get HDDriver.

> competitive for their taste.

Atari was a lost case long before they started to develop the Jaguar,
and also before they produced the Falcon. They screwed up during 1986 to
1989 when they had an extremely good and profitable business, but didn't
invest enough in development or in the wrong type of development (the
vaporware type). Remember when they had so much cash in the late
eighties that they bought some US chain store (which, a while later,
went broke)? If they had invested this type of money into development
(and also some into professional marketing), they would have had a good
chance of establishing a counter-culture against the Intel world.

[about the TT:]
> Atari do with such a revolutionary machine? They abandoned it, happy with

IMHO, the Atari TT already was late. It still was a very good machine,
though, as was the Falcon.

CH> Some PC users don't go higher than 640*480, which is the same
CH> as the standard Falcon, and most PC users don't use a higher
CH> resolution than 800*600

I would venture to guess that 90% of pc users don't *know* what res they are using. Probably 50% couldn't *spell* resolution, and wouldn't know whether it was measured in pixels or milliliters.

CH> As for the memory and hard disk consuming when talking about
CH> PC-programs, I'm totally convinced that it's either sloppy
CH> programming, where they don't care to optimise the programs, or

Why should they optimise? The more RAM and hd space they use, the more RAM and hard drives they sell. The only real question is whether they don't optimise because they are incompetent, or because they are under orders not to. Sometimes I think one, sometimes the other. The third option, that pc and Mac programs *must* be the size they are, is unthinkable. How about some opinion from those who might know?

I have an ICD Link 1 and the ICD Link software - it's worked flawlessly for me for years! I'm told the Link 2 is even better (faster throughput and can handle more drives). I have a 3X CD-ROM (great for software compilations) an external 540 meg hard drive and a 21 meg floptical drive for backups. I use Extendos Pro as the CD driver software and it works fine. I can even play audio CD's while using my 'puter to do something else - and that with no multi-tasking loaded - the CD player is an ACC! There are not many games on CD for the Atari but there are _many_ software compilations (some excellent) and you can use SARA programs to access some PC CD's. SARA is a commercial program but not expensive.

I've gotten permission from Chet Walters, otherwise know as the
\/\/iz of \/\/izWorks to put suprflag.prg and the doc file on the
Internet! This is a batch flag setter program. Set the flags on
everything on your hard drive, one partition, selected paths, one path,
the root directory or whatever! Sets ALL the different flags that need to
be set, STram, TTram, Fastload, you name it it does it! I know some
people don't like anyone to post binaries here in csast, so I won't do
that, unless I get a very large number of requests it! It's only 10645
bytes uuencoded! In the mean time anybody that thinks they need it send me
e-mail requesting it! I'd put it on umich (if I could ever get on there)
I usually use the mirror on toad.net! Anybody that want's to put it up
somewhere that everyone can ftp it from is welcome to it also.
I think everyone can use this one! If you have 100 files and only
2 don't work with fast bit, do you really want to set them all one at a
time, or set them all fast and go back and set those 2 slow?

By Katharine Stalter

HOLLYWOOD (Variety) - Atari Corp. president of North American operations Ted Hoff left his post Wednesday, following layoffs of 20 employees and amid reports that the company is liquidating its videogame assets.

Those assets include Jaguar, Jaguar CD, and Atari Interactive, a CD-ROM unit formed two weeks ago.

According to a report that first appeared in Bethesda, Md.-based Multimedia Wire, Jack Tramiel, who purchased Atari from Warner Communications in 1985, plans to use $50 million in cash currently tied up in Atari to make an investment in a computer hardware firm.

Sources close to the company said lack of interest in the business on the part of Tramiel and his family -- not lackluster sales -- is behind the move.

Hoff told Daily Variety he resigned because of the direction the company was taking with the layoffs: ``It was an indication that Atari's long-term intentions were not to continue in pursuit of videogame developing or publishing, neither for Jaguar nor Atari Interactive.''

Hoff said the layoffs include staffers from the engineering, testing, production, customer service, marketing, merchandising and advertising areas.

Those left, he said, don't constitute ``the ranks you would need to continue in the videogame industry.''

Before joining Atari in June, Hoff had been VP and general manager of Fox Interactive. Before that, he was senior VP at Time Warner Interactive.

Atari chief financial officer August Liguori denied any assets are being liquidated. ``We're not going out of the videogame business. We have $50 million, and we're going to continue making strategic investments and developing and publishing for all our platforms,'' he said.

But sources said it's unlikely that development deals already under way will proceed, and said the Jaguar videogame hardware and CDs are no longer being manufactured.

In addition, sources said, Atari plans to vacate its office space by the end of next month, and its warehouse must be emptied by the end of April.

> The above poster really isnt qualified to post technical details
> of Ataris.

You're a cretin, and an embarrassment to Falcon owners. Let me try to
explain this in simple terms which even Kevin Scruggs' less intelligent
friends might be able to understand.

When you're compiling a GEM application written in C, the linker (program
which produces the final binary) will fail to resolve the appl_init() call,
not to mention every other GEM function call, unless it can find a GEM
library containing the appropriate code. If it does, appl_init() will be
translated into a call to some code from the library which will (eventually)
execute the GEM appl_init function - resulting in a call to the operating
system. The compiler itself doesn't know what appl_init() means, and it's
not part of the standard C libraries, so you need a separate GEM library.

The internal workings of GEM functions are contained within the operating
system, but you need the library to access them from your C programs.

> Wintel clones have strong points. However, regardless of these points,
> they do have a HUGE resource footprint wrt to Atari's. Trying to
> deny it is just plain silly.

Big deal! I'm not denying it, just quibbling with your exaggerated
examples. The bottom line is that it's a pretty feeble reason for buying a
Falcon instead of a PC. Citing a dislike of Microsoft would be much more
reasonable, for example.

1621. Atari Ghostscript 3.53 Available.

Newsgroup: comp.sys.atari.st
Date: 1996-01-25 00:00:00 UTC
From: "Timothy E. Gallivan" <timg>
Message-ID: <4e6nbg$1bm@news1.is.net>
Source record: 152179

Hi,

An Atari port of Ghostscript 3.53 is available from

ftp://ftp.lifshitz.ph.utexas.edu/pub/atari/ghostscript/3.53/gs353b.zoo
or
http://godel.ph.utexas.edu/Members/timg/gs/gs.html

gs353b.zoo contains a 68000 executable and minimal support files.
gs353s.zoo contains Atari-specific source code and a cross-makefile.

This port isn't very well tested. I could barely keep my machine
working long enough to see that it ran and get it off my disk. It
should however fix the following deficiencies of previous versions:

1.) Better support for PDF documents.
2.) Color monitor support is restored (I broke it in 3.33).
3.) Ability to run without windows is restored (I broke it in 3.33 too).
4.) Ability to set environment variables from the GS startup file. I have
wanted to do this for a while, since it makes it possible for an
installation program to set GS up for the user. Unfortunately, I
haven't written an installation program, and if my Atari remains
broken, I never will. Maybe someone else wants to do this.

Regards,

Tim Gallivan

: You aren't the only one, the demon support newsgroup was *packed* with
: pissed off people messages. !!!!!

I started that thread in the hope that demon would do something about it.
That was a week ago and we're all still waiting - but maybe they are
trying to do something for the atarians

: Local Pops in london shouldn't be a problem, try CIX, recommended by
: those at Atari World.

I take it this is a ref to cix conferencing because Atari World have not
yet commented on the new parallel service of cix internet.

: The actual Internet connection is slightly more expensive but
: downloading news and mail is faster (as its compressed first) and many
: people sware by it !

The internet can be accessed from cix conferencing but with some
limitations. There is some debate about whether compressing news and mail
saves money or not. Comes out as useful if you have lots of data to download.

The people using atari systems to access cix internet are using mostly
CAB and StiK. There is some discussion about oasis and nos but the cix
mail system is POP3 rather than smtp. I don't know if anyone has tried
nospop3 with it yet.

I think things will look different again when ICE (oasis 2, without nos)
comes out

Hope this helps

Best wishes

Neil

Can anyone tell me what jumper needs to be changed (there are 8 or 9 pairings) on the Atari TT memory board that takes simms. (This is a small daughter board that sits above the mother board towards the front left (non-HD) corner of the TT? I would like to go from the current 1M simms to a couple of 4M simms if that is possible. I'm finding 4+4 a bit tight lately. Wayne Booth

It is used by hard disk drivers that support initiator identification and
bus arbitration (CBHD, HuSHI, HDDRIVER). The TTs SCSI ID is put in the NVRAM
and this is a feature approved by Atari.

Have you actually seen a TT? It has four DB9s for serial ports.
And two more for controllers, but they're on the keyboard. The fact
that the DB9s on the main box are for serial ports is made obvious
by the fact that they are clearly labelled "modem 1", "modem 2",
"serial 1" and "serial 2". Don't sound much like mouse or joystick
ports to me.

There is indeed a minidin for the "lan port" which is really a
serial port with the same controller as one of the serial ports.

1632. [FS] 8 MB ST RAM card for TT

Newsgroup: comp.sys.atari.st
Date: 1996-01-25 00:00:00 UTC
From: damms002@acpub.duke.edu
Message-ID: <damms002-2501961324120001@async181.async.duke.edu>
Source record: 152190

I have a 8 MB ST RAM card for sale. Put this in the ST RAM extension slot
and you have 10MB of RAM which can be accessed anytime by any programm
without worrying about how to force a programm which is not designed touse
TT RAM to use it.

Sure, not as fast as TT RAM but from my point of view more flexible.

This card goes new for 649 (Toad Computer)$

I'm asking 450$ + shipping

>
>
Depending on your version of TOS, you may already have access to the
flag. Just pull up the INFO on the file and see if it's there, then you
can modify it. (By the way, this flag only makes sense for programs, i.e.
PRGs, ACCs, EXEs and such.)

If memory serves, I think Charles Johnson of Codehead fame wrote a public
domain program called FASTLOAD.PRG. I may be wrong on the program's
filename. But it was a program that you placed in your auto folder and it
took over the job of allowing a fast load of a program without clearing
memory first. (Same operation as the flag per file.) With the advent of
the fastload flag being used with the newer versions of TOS (forget when
this actually occurred), then this FASTLOAD.PRG was no longer necessary.

Hope this answers your needs.

depends on the colour monitor. If its an ATARI SC* model then no, if its a generic monitor it
depends on its abilities.
On the other hand, as I'm thinking of getting a Falcon, I could offer your friend the following:
1040STFM 4MB , 48MB HD, High Rez Monitor and Software for the UKP250.

Andy.

Well, in the current climes it seems a little excessive, check out
ST format or some of the 'for sale' items here, you'll probably
find it a little cheaper than the above... Although the software
packages you mentioned are good if you need them... offer him 200. :)

You're gonna need a Harddrive and SCSI adapter too to make the system
'nice'. That'll be an extra 100-200 or so.

Happy Hunting!

I used Sumner Type in London Uk, who did a fine job of outputting my Calamus
files to bromides for sending to magazines. I send them a disk with the CDK
document on and any fonts used, and they output it. They do film too, for
really high-quality work. There are a couple of other places that accept
Calamus files in the Uk. The US though, I don't know.

****** For EPS files that's correct. PS is a little more difficult. The
modul makes the PS file without a header, which is individually different
for each printer. I havn't tried it so far but I have to contact DMC about
that anyway.

Maybe somebody else knows how to generate these headers ?

>
> -ME

Where do I start here?

I'll give it a shot:

>Umm.... The TT030 I got has this enviroment called
>TOS and GEM... How do I use it? Can I get something better?

TOS is the the OS of the ST/TT/Falcon, etc. GEM runs on top of TOS and
provides the GUI services of these machines. TOS originally stood for
"Tramiel Operating System" but Atari later changed it to "The Operating
System." There are replacement desktops available if you don't care for
the built-in one.

>Also, should I have the option of choosing TT high resolution?
>If so... it is not giving me that. Does this mean it is broken?

If you are asking why TT high resolution is not avaialable on the
preferences dialog, it is because high resolution requires a
different monitor. The TT can tell which monitor is plugged in
and will not allow you to switch to a resolution that your monitor
can't handle. I believe TTs use black and white 19" monitors for
high res.

>Needless to say, I am lost... Where on earth is the shell?

THERE IS NO SHELL. This fact is one of the primary reasons that the
ST/TT/Falcon computers have such a loyal following. Most of us
hate shells. This question makes me wonder why you bought a TT
at all.

>Anotherthing... My system has a modem1,modem2,serial1,serial2
>port... that is 4 serials I counted. What gives? AlsoWhat

Your machine has two mini-din style connectors. These are your serial ports. It also has to DB-9 style connectors. THESE ARE CONTROLLER PORTS. You can plug a mouse or joystick into the controller ports.

> Sorry for dumb questions... but this is first time
>I even turned on an Atari system and being used to NeXT, SVR4,
>and other UNIXes... this is really confusing here...:-(

Ataris are NOT Unix boxes (although they can be if you choose to run Linux). They are computers unto themselves --
enjoy it while you can, because this is becoming far too rare (the Mac is the last one left).

If you are concerned about paper format (larger than letter size), and
type styles, then you would probably need to work with a Printing
establishment. Unless you can afford the machines that can print on large
media sizes.

Usually I have found that most any establishment (that you run into on
any street) are more familiar with Postscript files. Because of that, I
made sure to get and update to the latest BRIDGE module from ISD/DMC.
ALthough they started with the Dataformer module, the latest Bridge
module has a much improved PS output.

Build your document in Calamus, then export it to a Postscript file. Take
that to the printer and see how it works for you.

Yes, and there are already a couple around, but when are we going to
get something that works with regular accounts (PPP and/or Unix shell)
like PC and Mac users use all the time.
Not everybody has SLIP.

>For me as a musician a fast plain PENTIUM would do nothing. If ATARI went
>out of business tomorrow, my Falcon with Logic Audio will still be a
>fantastic Audio system.

Well, let's face it- as far as we've all been concerned Atari's been
out of business ever since we bought our machines.
I don't think the difference will be such a great one even if Atari
really did go out of business. We've never had any support from them
anyway.

As for the Pentium- I guess it's a powerful machine, but with that
so-called operating system (I'd call it something else- like
"a commerical virus") you just can't do anything, and with the
"fantastic" (hmmm...) 'doze95 you'll have to wait around forever to
get it loaded, then wait again to reload because of all the crashes.
I wouldn't want anything like that even if I got it for free!

We migth experience crashes now and then as well, but not to that
degree, and a reboot doesn't take 2 minutes (with diskettes maybe, if
you have to load a lot of stuff), but then again you can't use disks
on a PC for loading major programs and the operating system.
I rest my case.

This sounds very much like what I've been having as well!
What happens is that I can be using my text editor and all of a sudden
teh keyboard takes control itself, re-typing some of the last keys
I've pressed, or simply slowing down everything- the menues, the
keypresses... that's when I press CTRL-S to save whatever I've got,
then it usually bombs and I have to reset the machine.

I also had/sometimes still have the problem of the computer "freezing"
in the middle of me writing.
This was so bad that I thought it was a hardware problem- I got hold
of another machine, but the problems continued, so it's definitely a
software problem.

I tried de-activating accessories and auto programs and thing started
to work better once I deleted "mauswindow" (automatic window topper).
I've replaced it with "Autoraise" instead.

Could it be that automatic window toppers cause problems on the ST?
I've been asking around, and nobody's had any problems like this with
"Mauswindow" before. It could of course be a combination of several
programs.

Maybe we could compare what kind of auto programs and accessories we
have installed and see if we have some of the same ones.
By the way, my machine is a 2MB STE with TOS 2.06.

Windows programs are bloated to the extreme, a fellow class mate today
compliled his 4000 line program using Borland C++ by the time he had
included the neccesary Windows libs it had increased to 120,000 lines.
I admit this is a slightly extreme case, but I doubt Atari code is quite so
bloated and hence slow. A simple windowing program for example will
quite happily use up less than 15k.

Hello. I have an Atari 1040STf setup I'm looking to sell so i can finance upgrading to something bigger and better. Includes 1040STf unit with TOS 1.0, 1MB RAM, 720k DD floppy, etc. and SC1224 Color Monitor, both in MINT shape. If anyone is interested, I'll let them both go for $150 total, plus shipping. Thnx, lemme know.

So long, and thanks for all the fish!

And please, no weird memory configurations! Like 1, 4 or 16 meg, but you
can't use 2 of the 16 so you really have only 14 meg. It should be, here
is slot. Put SIMM in slot, turn on computer. New memory now usable.

>
>So, is this true?

No. Well, not really.

Basically, IDE is the same as ISA-bus. All you need to connect an IDE drive
to a PC is some address decoding (one chip) and maybe a bit of buffering.

To connect to another computer it's not so easy.

>What are the advantages of IDE vs SCSI?

None at all. On the PC the interfacing is simpler, so it makes for cheaper
systems. It's generally slower although modern IDE drives approach SCSI ones
in speed.

The drives are only cheaper because more sell.

Another Reason to use zip instead of LZH, is that most of the
Gopher sytems that I have used don't know lzh from txt! All you get is a
totally munged file! Every type system knows zip is a binary file type! I
also happen to like the graphic interface and the ability to read
included files without extracting them! Sometime can't remember what
stuff is, this helps!

Well, every time I look in my \pc\lib directory I'm amazed that the
grand total of it barely gets over 200K. The GEM library is about 20,
IIRC. (BTW \pc is Pure C).

The binary of the `Write' program, part of MS Windows 3.11, contains a
contiguous block of 14K, filled with zeros. To name but one appaling
thing from the PC world. But on modern harddisks, this amounts to
about $0.004, so who cares, right?

What a sick world.

Regards,

You need to take a remedial english class of some kind.
Where does Falcon even appear above? Where is it even alluded to.

|explain this in simple terms which even Kevin Scruggs' less intelligent
|friends might be able to understand.
|
|When you're compiling a GEM application written in C, the linker (program
|which produces the final binary) will fail to resolve the appl_init() call,
Do you even have the slightest idea how a compilier, any compilier
let alone a C compilier even works?
|not to mention every other GEM function call, unless it can find a GEM
|library containing the appropriate code. If it does, appl_init() will be
|translated into a call to some code from the library which will (eventually)
|execute the GEM appl_init function - resulting in a call to the operating
|system. The compiler itself doesn't know what appl_init() means, and it's
|not part of the standard C libraries, so you need a separate GEM library.
It damn well better!
It's burned into the roms!

Admittedly the compilier has to build the call frame for the
given function. But that is NOT the same as needing to know
what appl_init(), it's a basic rudimentary function that all
C compiliers do (or better). All the library has to do is to
know to push the right number onto the stack and call trap.
A rudimentary thing to do, even without something like YACC
or Bison.

|
|The internal workings of GEM functions are contained within the operating
|system, but you need the library to access them from your C programs.
|
You show your total ignorance of GEM and C programming.
A trivial bit of inline assembler could access the same thing.

In fact, if you were adept enough to code in binary & coul
make your own basepage, a compilier or assembler would be completely
unneccessary..

The hard drive is internal. It goes under the cover on the right
side. That's assuming there is a host adaper in there. If not then you
will need an external HA before anything will work (Hard drives).

1660. GDOS

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <960126140005261 76@acpu.com>

gregor@shelly.goldengate.net (Bradly Maurer) spake thusly:

BM> Subject: GDOS
BM>
BM> Is there a FAQ for GDOS somewhere on the net.

Yes there is. Called The Joy of GDOS, as a I recall; joygdos.xxx, I think. Although as grim humor goes, the title has to be right up there with jokes about Dr. Death.

BM> I've never seemed
BM> able to come to grips with this program.

You and about a gazillion others.

BM> When I bought my secon
BM> mega gdos and g++ (though no fonts) came with it. Can anybody d
BM> to how to use this? I have a few apps that require this (arabes
BM> pagestream come to mind).

Bzzt. PageSTream does not require gdos, thank the moon and stars. And the Arabesque demo I got didn't either, IIRC. However, since the advent of Speedo and especially NVDI 3, I think you will see lots more (what am I saying? should read 'a few more') gdos-using apps, since (reportedly) Speedo and NVDI are much easier to set up than gdos1.1

I will try to help, but this will not be extensive. gdos.prg goes in your auto folder, a folder named gdos.sys or something like it, with the fonts and printer drivers goes in your C drive, and assign.sys goes in the root of C. The path to that gdos.sys folder must be specified in assign.sys.

A note to TT users - there is a TT_assgn.txt file around which replaces assign.sys, should you find that your gdos won't run in TT Medium.

>cylinder at which write precompensation begins) and the step-pulse width
>would be nice, but not necessary.

It's a 615 cylinder, 8 heads, 17 sectors _MFM_ drive, yielding 42 MB. Note that the Megafile 30 controller is RLL, squeezing 50% more capacity out of your drive. From my experience, the NEC drive's electronics and magnetic surfaces are not suitable for this - Seagate used specially tested drives here, as the "R" label on the drive proves. (The ST238R is identical to the ST225 drive, just that the 238R has the better surfaces in.)

bye, Peter

1663. Python 1.3 ported to MiNT!

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC
From: chrish@qnx.com
Message-ID: <nrml2mpm@qnx.com>
Source record: 151971
Cross-posted to: comp.lang.python,comp.sys.atari.st,comp.sys.atari.st.programmer

Announcing Python 1.3 for MiNT!

This is a more complete, and nicer (due to the inclusion of several extra modules and libraries) port of Python 1.3 to MiNT. Available on ftp.python.org in /pub/python/contrib/Porting/ as well as my web pages (http://www.qnx.com/~chrish/Atari/MiNT/python.html).

For full Python source code and anything else that isn't included here, go to ftp.python.org in /pub/python/src/python1.3.tar.gz (full documentation can be found on my web pages, as well as in the Python source archive).

Extra bits built into this Python:

- GNU readline 2.0; this gives you good command-line editing within Python... of course, it's only useful if you're entering programs right into Python (which is great for fooling around, etc).

- sockets! Yes, Kay's socket code (version 0.80) is here, so you can use Python with MiNT-net... combine that with all the spiffy network modules for Python (FTP, HTTP, NNTP, etc, etc) and we've got a very powerful networking tool here.

- GNU dbm 1.73; my port of this database library/engine is here as well, giving us nice fast databases directly from within Python

- George Neville-Neil's timing module:

- Lance Ellinghaus's rotor module (enigma-inspired encryption)

- Andy Bensky's "environment" module (contains putenv())

- David Wayne Williams' soundex module

None of these were in my last port, and the readline support was sorely missed by Eero. :-) It's his fault that I did this, actually; he kept bugging me about how great Python was, so I _had_ to check it out eventually.

Hopefully I'll have a cool little W or GEM application built soon with Python embedded in it as an expansion language (you'll be able to control what the program draws on screen from the built-in Python interpreter).

You can grab extra Python information and goodies (including loads of extra Python code, and the complete source archives) from:

Web: http://www.python.org/
FTP: ftp.python.org

Enjoy!

From: David Mitchell <dmitchel>
Message-ID: <4eav7g$cdb@dux.dundee.ac.uk>
Source record: 151975

Hello all Atarians,

I was wondering if anyone had a list of UK
User groups for the ST and if anyone had any
recommendations/warnings about any.
I used to be in the National Dragon Users Group
which was brilliant but there seems nothing similar
for the Atari platforms.

Thanks and take care,

Davy M

|
|||||I don't know of any ST C compiler which offers full GEM libraries and a
|||||resource development kit in only 1.5MB.
|||| ALL ST's come BUILT IN with full GEM libraries. They're burned into
|||| the ROMs.
|||
|||When you're compiling a GEM application written in C, the linker (program
|||which produces the final binary) will fail to resolve the appl_init() call,
|| Do you even have the slightest idea how a compilier, any compilier
|| let alone a C compilier even works?
|
|Have you?
|
|If you had you would know that the compiler needs all the functions you call
|to be in a library. It doesn't know what's in the operating system. It links
|your code with a library defining all the functions. Most of the gem ones
|simply put their arguments into the gem control arrays, call the operating
|system by a trap, and retrieve return values from the gem control arrays.
|
|But they still do something and you do need a library with them in.
The real library is still in the ROMS. The trivial bit you
keep on calling a lib is more linking than anything else.
|
|||system. The compiler itself doesn't know what appl_init() means, and it's
|||not part of the standard C libraries, so you need a separate GEM library.
|| It damn well better!
|| It's burned into the roms!
|
|No. NOWHERE in the ROMs does it know anything at all about appl_init().
Admittedly GEM itself knows nothing of the pnuemonic above.
However, function X in TRAP Y, is completely enumerated in
the TOS ROM. All any code need do is push the args to the
user stack, push X, push Y and call TRAP. GEM indeed does
the rest on it's own and that code is indeed burned into
the TOS ROM's and sits on the mboard of an ST.
|There is a trap which switches based on an opcode, and draws things or
|whatever. appl_init() is a C function which is contained in a library,
|admittedly one whose main (not only in this case) is to jump through
|that trap.
For any compilier writer to duplicate that code, which is infact
in the ROMS (despite what you might think) would be just silly.

|
|
|||The internal workings of GEM functions are contained within the operating
|||system, but you need the library to access them from your C programs.
|||
|| You show your total ignorance of GEM and C programming.
|| A trivial bit of inline assembler could access the same thing.
|
|Indeed, it /could/. That's not the point. You don't /need/ any libraries
|to do anything, as you could always code it yourself. The fact is that
|no-one in their right mind would write a GEM program by using inline
|assembler for every call.
Pagestream comes to mind. Fortunately 68K is a bit sensible.
|
|You could write Windows programs without a library as well. So what?
|
Not really. Every ST/GEM1 API call is burned into ST mboards.
The same is not true of wintel clones.
|||Big deal! I'm not denying it, just quibbling with your exaggerated
|||examples. The bottom line is that it's a pretty feeble reason for buying a
|| The major selling apps are HUGE. In some cases I even underestimated
|| the size of some of them. This just a fact of life with a clone &
|| you were just trying to weasel out of it.
|
|Can't you read? He was quibbling with some of your examples, in particular

1671. Recovering a Spectre partition - Success story

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <DLsqrr.8y3@freenet.carleton.ca>
Source record: 151979

I just recovered a Spectre partition succesfully. Using Diamond Edge.
for anyone who's interested in doing the same thing, this is what to do:

First: Back up your Partition info/SCSI info with Diamond egde to floppy
disk.

Then, run Diamond edge, and go to the partition dialog.

You will see your Spectre partitions marked as OOP or ACK. You can edit
them with Diaomnd Edge to make them into GEM or XGEM or BGEM, whatever is
appropriate.

Select install and rebuild one, and eneter the correct partition number
for the Spectre partition.

The computer will reboot. I ran Diamond Edge again, and wiped the
partition, just to be sure, ran a check for bad sectors, and did "copy
partition Defrag" to move the partitions back to the same way they had
been before

(partition 3 had been Spectre, so I now had a new E partition. In order
not to screw up my exsiting Desktop.inf's and other configuration files, I
copied F-E then G-F, then H-G, then I-H, then I wiped I. I had
essentially the same structure as before, with a new partition at the end
of the chain. Now, I'll just install MInt/Minix onto partition I...)

I was able to recover teh Spectre partition without having to format the
entire hard disk, and without losing any data. If you are going to try
this, be sure to back up your data/partition info before you start, just
in case!

1680. Warp 9 question

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC
From: gregor@shelly.goldengate.net
Message-ID: <1197cc$142e8.2a5@goldengate>
Source record: 152054

I just waded through a group of posts dealing with W9 vs nvdi and it piqued my curiosity. When I bought my secondhand Mega it came with W9 installed. I understand that it's a screen accelerator. But what else does it do?
I have to admit that I really don't use it too often because it seems incompatible with most of the programs that I use. It crashes my version of Cubase and eliminates some of the graphic functions in my term programs. I use teddy term and FDZ. When using it with these I seem to unable to see the highlight bar or the bold/selected messages in pine on my server. Any suggestions?
I might use it a bit more often I knew exactly how to! I understand that you can get screensavers etc for it how does this work? It's that no documentation problem....

1681. GDOS

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC

Is there a FAQ for GDOS somewhere on the net. I've never seemed to be able to come to grips with this program. When I bought my second hand mega gdos and g++ (though no fonts) came with it. Can anybody direct me to how to use this? I have a few apps that require this (arabesque and pagestream come to mind). I've just never figured this out!

1682. Does a Pentium make your wank bigger? was Re: Is FALCON worth buying?

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC

Some one said;

>Or there's always Windows Terminal, which is included with a default
Windows
>installation.
>
>> DTP: 15M vs 1.5M

>Let's just see who can still find new software for their machine in 5
years'
>time, shall we?

Ye gad, you do know the ST isn't dead yet, don't you? That has been
at least ten years ago. You did reference a C package you use.
Do you not think that a benifit of the Falcon is the ease at which
it is programed. Anyway, I can't honestly think of a
package that does not meet my computing needs that is
not available for the Falcon now. Why would those needs have
to change in 5 years. My hearing surely won't get any better,
(audio) and I doubt that I will ever see more than 16bit color
through my eyes. Another question to you, why in the hell is
Douglas Little and like coders spending time in the Falcon market?
Doug had wrote a nice little response here a while ago, I wish I had
kept it. It boiled down to the fact he enjoys working with the
Falcon. I would bet that many others do as well.

>
>And to think that three years ago, I was heavily pro-Falcon and anti-PC.
>Self-righteous Falcon-owning tits are becoming as irritating to me
>first place.

Tell me, are there any good topics in the PC newsgroups that
you attend. If there is, why would you drift over to this
motley group?

The Windows terminal program? With a maximum setting
of 19k baud, I think we can rule that out of the compairson.
Just add HSModem6 to your Auto folder and 115k is available
on the Falcon (actually more).
It sounds like your compairing old dos programs to the TOS
equals (or should I say unequals). You don't need a Pentium
to run those. And without Windows protection mode, you must
be having a lot of fun managing anything over 640k for your
old dos programs.

My bottom line for owning a Falcon or two is the enjoyment
I get out of it. I've got a fast Mac. I've got a fast
PC, and I still enjoy the Falcon more.

I still let the female gender give me my hard-on's, however.

Mike

I don't see any serial patch program. I doubt your running at 2400 bps
so you need HSMODEM. I think FPATCH only changes the address of the
port you're using.

Eric Palm (darkforc@darkforc.tiac.net) wrote:
: I got Xformer 3.31 from your web page, thanks.

: My userid, password is not good for Gemulator 95, though.

: BTW this is eretic@tiac.net (darkforc is my slip account, my
: IP seperates it's slip from shell accounts, being two different
: mailboxes, etc).

: Did Toad also tell you about my Gemulator registration, or
: just Xformer?

: Anyway, I'd like more info on what the drive cable is all
: about. I bought St Xformer 3.0 a long time ago, with
: the ST Xformer cable. Is the PC Xformer cable, much along the
: same idea? Same electronics, or different?

Ok, I got a response from Darek on this message, and he has helped me out.

The newest Gemulator 4.11 is very much improved, and has alot of glitches taken out of it. As I went right from Gemulator 4.0 and missed the experiences of 4.06, 4.10, etc. I didn't see the gradual improvements, so they were more evident than most people would see.

I haven't had a chance to test the MIDI, nor much testing of the sound.

Although getting games to slow down can be a pain with the suggestion of a CPU eater program running in a dos window; Darek tells me he's going to work on having a slowdown feature for games that aren't designed to work on anything faster than an 8 mhz ST.

Also, I really like the Gemini Atari CD I've had for over 2 years now.

I am able to access it directly and run software off it without difficulty.

Quite amazing, and convenient for sure.

Also got the latest upgrade for PC Xformer 3.3. You wouldn't notice from the looks of it any difference, but throw some games at the emulator that wouldn't work before and see what happens now.

I understand Darek's views on piracy also, although for a long time I thought nothing of pirating software on the ST, and may in fact have inadvertadly contributed to the demise of the Atari.

I hope to rectify some of the wrong doing in the past, by now registering shareware, and deleting archival pirated copies of software. Even though the companies are out of business, I feel it's the least I can do.

I will sooner now register a piece of shareware for the Atari that runs on Gemulator in it's current state, than pay for a Microsoft product of similar value.

I know Darek works for Microsoft and BRASoft is company he started up on his own. But I feel the moguls of Microsoft don't need everyones undying passion. And much of the Shareware and Freeware is very good.

Windows 95 and the Plus pack may be my last Microsoft purchases for awhile.

So now I'm saving up for registering my favorite St software, once I dtermine that they work as stated under Gemulator.

Have fun in your discussion, I will watch, but won't reply to flames.

Darek is not the self-centered person people make him out to be, he's just to busy to be reading and replying to mail 24 hours a day, as many of you have time to do.

Eric

Only if you want to. You might want to so you can run telnet in a window,
but it isn't necessary.

>Should I set up a Minix partition?

Some things need it, but it isn't generally necessary. Also a few things
will require a unix-like filesystem layout, but again most don't or can
be set up not to.

1688. Wanted: Lynx games for children. Any?

Looking to buy Lynx games for a young child (are there any simple enough?).
Oh, heck, I'll admit it: I'd like a new game too.

My three year old enjoys shooting guns while flying "upside down" playing "Blue Lightning". [He pushes buttons but things quickly can get confusing at times!]

Personally, I'm tired of BlueLightning, Klax and California Games and so I wouldn't mind something new too.

I'd be willing to swap for ST Format EuroMags that I've still got.

As of today, I've got the following ST Format Magazine issues for sale:

Issue Month Year # Left Cover Price
----- ----- ---- ------ -----------
#70 May 1995 1 8.65 US$
#71 Jun 1995 2 8.65 US$
#72 Jul 1995 2 8.65 US$
#75 Oct 1995 3 8.45 US$
#77 Dec 1995 3 8.45 US$

All Mags are new (in other words: no dog ears, thumbprints or rips!) and include whatever floppy disks they're supposed to come with. Prices may vary.

An 1040 STE doesn't have an SCSI interface. It is the little "smaller"
ASCI. You'd need a hostadapter to link an SCSI hard drive. So the question
is : What sort of thing is your 52 meg quantum drive ? It cannot be the pure
drive, it must have some sort of linking hardware. The drive can be
either MFM/RLL (not very likely, especially if it is a recent thing) or
IDE (not likely either, 'cos AFAIK noboby achieved to build an IDE-ACSI
hostadapter) or real SCSI (most likely). In the latter case you should be
able to use the drive without the hostadapter on Ensoniq thing (What is
it anyway ? Never heard that name).

Cheers Peter

Just download it !!!! It lies virtually everywhere.
I cannot contemplate why people keep complaining that they miss things,
that really exist for quite some time now. Get MiNT, MiNTnet, WWW116
and cab-for-mintnet164.tar.gz and you'll have an excellent web browser
that connects via SLIP, CSLIP, PPP or even Ethernet.
By the way, web browsers for MiNTnet, however not GEM based, exist for
years now !

I think it's time to stop mourning and start looking what's there. If you
just take a little time to dig in nowadays atari ftp servers, you'll find
so much software you've never seen before that it'll take you til your
life's end to test it all.

>
You might want to use TOSWIN if you want to use a ftp client while using
a telnet client while using a news client. These programs are only
available as unix-like commandline oriented version, with the exception
of ftp : There is DUftp by Craig Graham, which is a GEM based ftp needing
MiNTnet.

There is no real need to set up a minix partition, unless you wanna make
extended use of network services with even providing servers and so on.
If you completely stick with MiNT I'd recommend a minix file system
anyway. But for a start you can do without.

Go and get a recent MiNT V1.12 and MiNTnet V0.8 and you already have most
you need; all to set up the links. Read the docs. Installing MiNT ist
really simple and straightforward. MiNTnet is a little tricky though. But
anyway you still have us to help ;-) But RTFM first !

Cheers Peter

1694. MegaSTE SCSI info

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC
From: orendorf@upsilon.cs.fsu.edu
Message-ID: <4e9oe7$5ab@news.fsu.edu>
Source record: 152068

I've been given a Mega STE (TOS 2.05) with 4MB of memory and no hard disk drive (or manuals). I know that it has a built in SCSI controller, so I tried connecting a Syquest SQ555 removable HD (44MB per cartridge). During boot the drive didn't get recognized or even queried by the controller. The drive itself is a SCSI 1 device (id 2) and the cartridge was formatted under DOS (v 5.0). Seeing as I have *no* experience with using my new toy, I was wondering what it takes to get TOS to recognize a newly added device. Are there any DIPs to flip or special programs to run? I've tried GEM's "Install Device" option and manually installed an icon for drive C: to no avail. Does the disk need to be specially formatted?

Finally, is there an FAQ for this (or .tech) group? Any p.d. documents that covers this kind of stuff? Any good books you can recommend?

Thanks in advance.

-Jason

Have you?

If you had you would know that the compiler needs all the functions you call
to be in a library. It doesn't know what's in the operating system. It links
your code with a library defining all the functions. Most of the gem ones
simply put their arguments into the gem control arrays, call the operating
system by a trap, and retrieve return values from the gem control arrays.

But they still do something and you do need a library with them in.

>|system. The compiler itself doesn't know what appl_init() means, and it's
>|not part of the standard C libraries, so you need a separate GEM library.
> It damn well better!
> It's burned into the roms!

No. NOWHERE in the ROMs does it know anything at all about appl_init().
There is a trap which switches based on an opcode, and draws things or
whatever. appl_init() is a C function which is contained in a library,
admittedly one whose main (not only in this case) is to jump through
that trap.

>|The internal workings of GEM functions are contained within the operating
>|system, but you need the library to access them from your C programs.
>|
> You show your total ignorance of GEM and C programming.
> A trivial bit of inline assembler could access the same thing.

Indeed, it /could/. That's not the point. You don't /need/ any libraries
to do anything, as you could always code it yourself. The fact is that
no-one in their right mind would write a GEM program by using inline
assembler for every call.

You could write Windows programs without a library as well. So what?

>|Big deal! I'm not denying it, just quibbling with your exaggerated

Can't you read? He was quibbling with some of your examples, in particular
the C compiler, not with your general point which is undeniably true,
(although less relevant now hard discs are so cheap)

> Buy a clue somewhere...

No comment.

1708. Installing Mint on Gemulator

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC
From: eretic@tiac.net
Message-ID: <4ea1tl$arc@sundog.tiac.net>
Source record: 152082

Well, looks like with a little figuring out what I was doing, I am now installing the Mint distribution set from a.a.u.e. . 9 discs of the Unix like OS. I found I have to use the VHD files even in Gemulator 4. But I have the full minix file system, and I'm working on the 3rd disc of the set (it's installing in the backbround :))

I'm anxious to see the Atari Manager X Windows interface at 1280 x 1024 within Gemulator. Get Sauron running, and see what flies.

1710. CAB Crashes!

Newsgroup: comp.sys.atari.st
Date: 1996-01-26 00:00:00 UTC
From: bjr@EbiCom.net
Message-ID: <4e9vcg$kdv@Einstein.ebicom.net>
Source record: 152084

Well, it looks like CAB is so close to being real...
I can somehow manage to grab most of the web pages I try...
But...
Tons of them cause the system to crash...
I suspect this happens when CAB trys to pass a file to another viewer.

A good example of most of my crashes is when I click on an archive or graphics file to download. It downloads...then two or three bombs every time. I know it's not STik, and have a good feeling it's not the ovl causing the problem...because if I call up that file from the wwwcache folder...it's all there, and doesn't seem to be corrupted.

Some pages crash really quickly...i.e. wuarchive.wustl.edu no matter what options I choose...is it that CAB doesn't understand what to do with something in the page?

This program is so close to being GREAT...will anything come of it?

Brian

>I thought you weren't going to print any more once you'd got rid of the
>remaining few of the current batch, that doesn't sound much like still
>in print to me :)
The book is still in print and copies are still currently available.
What happened was book sales of the second edition picked up tremendously and
I did a third edition.
The sales are slowing down quite a bit again, and so this batch will probably
be the last.
However, as happened last time, if someone makes a large order then another
batch will be printed.

>

Why not try KNARF'S MiNT distribution.

I grabbed it from ftp.phil.uni-sb.de/pub/atari/mint/KGMD-1.0.

The installation is handled by a script, so all you need to supply is the ST :)

You really need a 4 Mbyte ST with at least one hard disk partition that
you can allow to be converted to a Minix partition.

The distribution instructions are in German, but the install flow is
stepped, so that you only install what you want.

It starts by installing Mint; then converts a partition to Minix; then
installs various packages.

The paackages are:

BASIC (sets up a Unix-like environment)

COMPILER (sets up GCC compilers)

MANUAL (Installs the man pages & other documentation for the various utilities)

NET (Networking - Mintnet)

X11 (The X11R5 software)

As the packages are well defined, you only D/L what you want.

You could also try the TAF distribution, should be on umich; you could
post for more infor from users.

> sampler scsi?
> Please, all replies will be appreciated.

The ST does not have a built in SCSI controller, it does use a host
adapter to convert it's ASCI port to a sort of a SCSI port.

Do you have one of these (like the Link or Translator) or is your built
into your harddrive?

It is possible that your Quantum is a SCSI drive, does the Ensoniq use an
internal or external SCSI drive?

If it's internal, you may be able to fit the Quantum.

If it's external, you may be able to cable it up by removing the host
adapter & using the drive in the existing box.

>I'm looking for a cheap sollution to use Ethernet with my Falcon...
>
>Any solutions? I'm interested in Software for Linux and MinT-net.
>
> Christof
>

For You and the others asking for ethernet cards and atari st/tt/falcon:

1) No cheap solution.

2) RIEBL cards are not produced any more (I think), they
where about $400 each. I use a VME RIEBL card in my TT030
and a ST-bus RIEBL card in a MEGA ST-4.
Maybe Michael Gehret (+49.8334.1411, "XSOFT") still has
some in stock.

3) There is another company in germany (PAM Software GmbH)
who used to sell ethernet cards and external devices
(ACSI), but I dont know if they still exist:

PAM Software GmbH
Voice: +49.6131.476312
Fax: +49.6131.476402

I think that there is actually no Linux-m68k driver for an
ACSI (DMA) external solution.

4) External ethernet boxes for the CENTRONICS port are reported
to work fine but *s*l*o*w* and require hardware modifications
in Your atari.

Thats all I know. Maybe You would prefer to use slip ore ppp...

Two things on that:

1) It would be good to have ALL authors who work on AES replacments to work together. That includes also Andreas Kromke (Magic 4) and the author of N AES - both have E-mail adresses so they can be reached using Internet.

2) the best thing would be, if some of those programmers could team up and melt their programs into one. I think that would stimulate development speed considerably. I don't think people need 5 to 6 new AES replacements, each with its own extensions. If that happens, noone will actually support new features of one AES, the others don't have.

3) If 2) shouldn't be possible (at least let's say to have just 2 AES replacements), the next idea would be for the programmers to have "Meetings" on a periodical basis ti implemnet AEs standrads.

That is, all can do their own extensions and improvemnts and should agree on those extensions, that have to be present in all AES implmentations (like it is done in compiler development with ANSI, e.g. Fortran 77, Fortran 90 etc.)

The starting point can be AES 4.1; thereafter, a reference AES 5.0, 6.0 etc. should be designed.

The Falcon has a 1.44 HD floppy and can read and
write to the older 'Extended' Atari formats, too. If you can find
one of the 3rd party format programs, you can format a 1.44
diskette at 1.88 Megs. Of course, don't try to use these on
a PC. Only good for the Atari.

AFAIK you should use ID0

> under DOS (v 5.0). Seeing as I have *no* experience with using my new toy,

Try to format it with a proper ST-Tool

> I was wondering what it takes to get TOS to recognize a newly added device.
> Are there any DIPs to flip or special programs to run? I've tried GEM's
> "Install Device" option and manually installed an icon for drive C: to no
> avail. Does the disk need to be specially formatted?

You'll need a driver for your Syquest (which comes with the Tool to
format and partition your drive - there are a lot like SCSI-Tools,
HDDRIVER, CBHD, ICD, AHDI) Then you can do the "Install Device" thing.

So long,
Hampf

Just price, really. They are produced in such HUGE quantities for the PC market that the margins are very low.

On the downside you buy extra intelligence in the embedded SCSI controller so that speed and fault handling are better than IDE.

You can add a 68030 upgrade board - but its not cheap. I sold my MSTE for
a TT because I wanted to run Linux.

> UNIX-like (multitasking, etc.)? Is there any software available for

Best bet would be MiNT. Very UNIX BSD like - and even has its own X11R5
server. I ran this very succesfully on my MSTE for a couple of years (not
the X server though as this wasn't available until after I sold the MSTE.
It *should* run just fine though).

> and displays windows and returns keystrokes/mouse to the server etc.

The X server is the bit which displays the windows and does the input. So
to display Xapps on your ST will have to run an X server on your ST. The
Linux machine is actually the X client engine.

Client/Server terms under X are the other way around from normal networking
terminology.

OTOH I think it would be possible to build some sort of 'echo' for a X server
on a lesser machine. This way the Linux machine still does most of the hard
work - and all the ST would do is paint the screen and return input.

Nothing like that exists for the ST AFAIK ATM.

Roland.

While its true to say the ROMs have all the GEM routines builtin - this
is hardly the same thing as saying they have full GEM libraries built it.

A C compiler needs libraries to make use of system features. Otherwise it
hasn't a clue how to call them.

The same can be said of most operating systems.

Yes, it is a 3.5" HD floppy drive.
put in a hd(1.4meg) floppy disk and try to format it.
A hd drive can read any atari formatted disk, a pc formatted disk, but not a
MAC formatted disk AFAIK.

From: rand@cd.chalmers.se
Message-ID: <4ebtpc$2un@nyheter.chalmers.se>
Source record: 151989

BAD MOOD 1.7alpha has just been released and is available for download
via WWW or ftp at the usual place (see .sig).
(This is a binary only release.)

Finally there's texture mapping! Everywhere! :-)
(Only two textures are used currently, though.)

Due to a lot of DSP code and smart algorithms, the program is still
very fast.

Enjoy!

In case you've not heard about BAD MOOD (where've you been?), it's an
internet project to create a free (even the sources are normally
available) DOOM(TM) WAD compatible game for any Atari Falcon030.
The program should be able to load any DOOM, DOOM2 or Heretic WAD
(but this new version with texture maps might only run with the
original WAD from Id Software).

Hello Gabriel,

GP> I have a Falcon and I plan to use it for multitrack
GP> HD recording, so I need to buy a "big" (1 or 2Gb) hard disk...

I use one Conner CFS2105S (2.1GB) and one Conner CFS1060S (1.06GB) and both work very well with Cubase Audio. The sad part about big hard drives is that they have to be partitioned into many partitions. If you want to work with Cubase Audio, you need a sector size of 8kB maximum. When partitioning with HDX, the max size is 256MB/part. I use SCSI-tools, where you're allowed to change the sector size within some limits, and here I can get 512MB-partitions instead. The 1060-disk can be parted in two parts and the 2105 has to be 5 parts, since it's a little too big to part in only 4. There is another disk, CFS1080S (1.08GB), which is just a little too big to be parted into 2 parts and has to be in three...
If you need to ask something else, don't hesitate to send me a mail.

I've used NVDI since it saw the light of the day and it's always worked with Cubase too. Now I run Cubase Audio on my Falcon and I would go nuts if I didn't have NVDI installed, because the screen updating is very slow. NVDI changes that radically! Buy NVDI immediately - test it once and you can't live without it!

HDdriver is a very affordable and excellent product IMO. I had no trouble
setting up large minix partitioning with it but don't know that it was the
reason since I was until the original post in this thread blissfully unaware
as to any "limits" of this nature with minixfs.

So basically your point is this: GEM is ROM-based, but Windows is disk-based. Thanks for bringing this to our attention; I'm sure nobody was aware of this absolute SCANDAL.

And to suggest that you could avoid the need for GEM libraries by using inline assembler is absolutely ludicrous. You could do the same with Windows if you could really be bothered. So what's your point?

>|You could write Windows programs without a library as well. So what?
> Not really.

Yes, really. What could a Windows library possibly contain that you couldn't duplicate yourself?

> Every ST/GEM1 API call is burned into ST mboards.

Well, it happened again! (see my previous posting).
But this time the system didn't crash, so
what instead of simply rebooting the system I let it run like that
trying to analyze the situation.
This is what I saw (from the desktop, unless specifically noted):

-The rotating "Fuji" symbol (Fujidesk) seemed to rotate at the usual
speed, and so did the animating mouse pointers for the different
situations (i.e. moving objects, busy bee etc.)- as I've used
"Mousekamania II" to change my mouse-pointers into animated (moving)
ones.

-The movement of the mouse itself seems perfectly okay though- I can
move the mouse as quickly as I want and the pointer still follows!

-when double clicking a text file and displaying it on the screen, the
scrolling went just as fast as it normally does.

-starting/exiting programs works fine (or did at least this time), and
loading a program (as well as exiting) seems to go just as quickly as
always.

(previously, programs have crashed- but this might have something to
do with me panicking when I see things slowing down- so I try to save
the stuff as quickly as I can, so I can at least continue with what
I've been working on after a reboot- I press CTRL-s as I'm usually in
an editor ('Everest' most of the time), and because I don't feel
there's time to move the mouse and get to the menu. I don't know if
that would have changed things regarding the crash anyway).

-I tried going to the "Selectric" file selector, moving the scroll bar
